NORTON, Charles Eliot, b. Mass. 1827; son of the Rev. Dr. Andrews Norton. After graduating at Harvard college, in 1846, he entered a commercial house in Boston to learn the details of the East India trade. In 1849 he went out as supercargo of a ship consigned to India, through which he traveled, returning to Boston by way of Europe. In 1855 he again went to Europe where he spent two years, and he was once more abroad 1868–73. In 1875 he was appointed professor of fine arts at Harvard college. In 1855 he edited, in conjunction with Dr. Ezra Abbot, his father's *Internal Evidences of the Genuineness of the Gospels*, and translation of the gospels. He edited the *North American Review*, in association with James Russell Lowell, 1864–68, and during the rebellion he edited the publications of the loyal publication society at Boston. His *Considerations on some recent Social Theories* appeared in 1853; *Notes of Travel and Study in Italy*, 1860; and his translation of Dante's *Vita Nuova* in 1867. He is an accomplished Dante scholar,

and Karl Witte's edition of the *Vita Nuova* is dedicated to him. He published in 1880 *Historical Studies on Church Building in the Middle Ages.* He is president of the archæological institute of America.

NORTON, John, 1606–63; b. Stortford, Hertfordshire, Eng.; educated at Cambridge; became curate of Stortford. Having embraced Puritanism he came in 1636 to Plymouth, Mass., where he preached the first winter; was pastor of the church in Ipswich in 1636; was a member of the convention which framed the "Cambridge platform" in 1648; became colleague of the Rev. John Wilson, minister of the first church in Boston in 1652, and in 1662 went with gov. Bradstreet as agent of the colony to present an address to Charles II. after the restoration. He wrote many works, one of which was a treatise against the Quakers, entitled *The Heart of New England rent by the Blasphemies of the Present Generation*, by which they were so enraged that after his death they informed the king that "John Norton, chief priest in Boston, was smitten and died by the immediate power of God."

NORTON, William E., b. Mass., 1843; was apprenticed when young, to a house, sign, and fresco painter; went to sea at the age of 18; at 22 he commenced marine painting in which he became successful.

NORWALK, a township of Connecticut, on both sides of the mouth of the Norwalk river and Long island sound, on the New York and New Haven railway, 45 m. n.e. of New York, and 31 s.w of New Haven. It has manufactories of iron, machinery, hats, felt-cloth (of which two companies make 500,000 yds. per annum,) 16 churches, etc. Pop. '70, 12,119.

NORWALK (*ante*) a t. in Fairfield co., Conn., has a fair harbor and is the terminus of the Danbury and Norwalk, and the Shepaug Valley railroads; pop. '80, 13,956. There are several public halls, a public library, schools and academies, 5 banks, 15 churches, 2 daily papers, several hotels and a large number of mills, foundries and factories. The lock-works and iron-works are among the most extensive in the country. The people are largely engaged in the oyster trade, sending great quantities to New York annually. There are two or three hot-house nurseries, and a large trade in flowers is carried on with New York city. Woolen goods, hats, shoes, and straw articles are among the manufactures. That portion of the township lying upon the Sound and through which the New York railroad passes is known as South Norwalk. In the upper or north portion of the town, which is built upon rising ground, are many pleasant residences and country seats. The union school building is one of the handsomest in the state, and there are several private academics.

NORWALK, a t., the co. seat of Huron co., Ohio, 56 m. w. of Cleveland, on the Lake Shore and Michigan Southern railroad, pop. '80, 5,704. It is situated on a long sandy ridge, with streets shaded with double rows of maples. It has gas and water works, flour and saw mills, machine-shops and foundries. There are churches, schools, banks, and 4 weekly newspapers.

NORWAY (Norweg. *Norge*), the western portion of the Scandinavian peninsula, which, together with Sweden, forms one joint kingdom, is situated between 57° 58′ and 71° 10′ n. lat., and 5° and 28° e. long. It is bounded to the e. by Sweden and Russia, and on every other side is surrounded by water, having the Skagerrak to the s., the German ocean to the w., and the Arctic sea to the n. Its length is about 1,100 m., and its greatest width about 250 m.; but between the lats. of 67° and 68°, it measures little more than 25 m. in breadth. The following table shows the areas and populations of the 20 aemter into which Norway is divided, as given in the last census of Jan., 1876:

Aemter.	Area in English sq. miles.	Population in 1876.
Smaalenene	1,548	107,629
Akershuus	1,986	114,778
Christiania	2	77,041
Hedemarken	10,034	119,774
Christians	9,670	115,988
Buskerud	5,659	101,867
Jarlsberg and Laurvik	861	89,320
Bratsberg	5,707	83,986
Nedenæs	3,855	75,979

RUSSELL, STRUTHERS & CO., ENG'S, N.YORK

Of this total, only 332,938 live in towns. At the preceding census on Dec. 31, 1865, the population was 1,701,756.

The Scandinavian peninsula consists of more or less connected mountain masses, which, in the s. and w. parts of Norway, constitute one continuous tract of rocky highlands, with steep declivities dipping into the sea, and only here and there broken by narrow strips of arable land. South of Trondhjem (63° n. lat.), the ridge expands over nearly the entire breadth of Norway. The n. portions of the range, known as the Kjöllen Fjelle,* occupy a space of about 25 m. in width and form, as far n. as 69°, the boundary-line between Sweden and Norway. South of 63° n. lat. the range of the Scandinavian mountains is known as the Norska, or Dovre Fjelle, although the latter name belongs properly only to the part immediately in contact with the Kjöllen. The general elevation of the Norska Fjelle does not rise above the line of perpetual snow, whose average height in these latitudes is 5,000 ft.; but it ranges above that of the growth of trees, which may be stated to lie 1000 ft. lower. Only two carriage-roads traverse the Norska Fjelle, the one connecting Christiania with Bergen, and the other with Trondhjem. The Justedal glacier, in Bergen amt, is the largest on the continent of Europe, and covers an area of 588 sq. miles. The whole of the w. coast of Norway is densely fringed with islands and isulated rocky masses, which, n. of 68°, in the Lofoden (q.v.) group, assume larger dimensions, and form extensive insular districts. The more important are Hindö (357 sq.m., 8,190 inhabitants), on the borders of Nordland and Tromsö; Langö (147 sq.m., 5,812 inhabitants); Karmö (only 21 sq.m., although the pop. is 11,827); and Senjen (273 sq.m., with 3,339 inhabitants). To the s. of the Anden group, near the little islands, Mosken and Værö, occurs that eddying whirl of counter-currents known to us as the Maelström; but with this and a few other similar exceptions, no serious obstacles impede navigation along the numerous channels of the coasts. The most important of the rivers are the Glommen (350 m. long, with a basin of 6,657 sq.m.), the Drams-elv, of less than half the length and basin, Tanæ, Pasvikel, Skiens, Laagen, and Vormen. These and numerous other streams are of more importance for floating down timber to the fjords than for navigation. The fjords or inlets form a characteristic feature of Norwegian scenery, and give a coast-line of upwards of 800 miles.

The most considerable of the lakes of Norway is the Mjösen, near Christiania; but even this lake, which in some places is more than 1400 ft. deep, is scarcely 60 m. long, and has an area of less than 200 sq.miles. Swamps and morasses, which occupy a large area, have of late years engaged the attention of the government, which is endeavoring to drain and utilize them for agricultural purposes, and with a view of converting them into fields of turf and peat for fuel.

Climate, Soil, etc.—The peculiar physical character of Norway necessarily gives rise to great varieties of climate in different parts of the country. The influence of the sea and of the gulf stream, and the penetration into the interior of deep inlets, greatly modify the severity of the climate, more especially on the w. coast. Thus, while the mean annual temperature is for Christiania, on the e. coast, 41°, it is 46°.8 Fahr. for Bergen on the w. coast, which is only 30′ further north. On the coast generally, rain and fogs prevail; while in the regions near the North cape, storms are almost incessant. In the interior, the air is clear and dry, and the winters are cold and the summers hot, while on the coasts the opposite conditions prevail. The longest day, which in the s. is 18 hours, may be said to be nearly three months in the high latitudes of the n. districts, where the longest night lasts almost an equal length of time. The protracted winter of the n. regions follows almost suddenly on the disappearance of the sun, when the absence of solar lights is compensated for by the frequent appearance of the aurora borealis, which shines with sufficient intensity to allow the prosecution of ordinary occupations.

It is estimated that $\frac{1}{38}$th of the area of Norway lies within the region of perpetual snow, while elevations exceeding 2,000 feet above the level of the sea are unfitted for human habitations, although for a portion of the brief summers, the herdsmen can occupy *sætre* or huts at elevations of 3,000 feet and upwards. A large extent of the mountain districts yields no produce beyond scanty grasses, mosses, lichens, and a few hardy berry-yielding plants. Only birch and juniper grow n. of 67, which is the boundary of the pine. The Scotch Fir. *Pinus sylvestris* (Norwegian, *Fnrn*), and Spruce, *P. abies* (Norwegian, *Gran*). cover extensive tracts, and with birch. constitute the principal wealth of Norway. The hardier fruits, as strawberries, gooseberries, cherries, and raspberries, are abundant and excellent of their kind. Hemp, flax, rye, oats, and barley are grown as far north as 66; but although agriculture has been more systematically pursued of late years, the crops are not always sufficient for home consumption, and hence it is found absolutely necessary annually to import considerable quantities of corn and potatoes. The frugal peasantry do not, however, rely wholly upon importation, but prepare a species of cake or bread from the bark of the pine when corn is scarce, and in plentiful years store away some of the produce of the harvest in the national corn-magazines, which are established in every part of Norway by way of a provision for an unfavorable season. Agriculture is most successfully prosecuted in the amts of Jarlsberg and Laur-

* *Fjelle* is the plural of *fjeld*, a mountain-side.

vik, and in the south generally; while in the northern parts, in the upper valleys, the rearing of cattle constitutes an important branch of industry. The herds and flocks are driven from the distant farms to the pasture-lands in these high mountain valleys, known as Sæterdale, where they remain till the approach of cold weather obliges the herdsmen to return with their charges to the shelter of the farms. Although the cattle and horses are small, they are generally strong and capable of bearing much hard labor.

Products, etc.—Fish are caught in almost every stream and lake of the interior, as well as in the fjords of the coast, and in the bays and channels which encircle the numerous islands skirting the long sea-line of Norway. Salmon, herring, and cod are of the greatest importance, and together give occupation to upwards of 50,000 men, who pursue the herring and cod fishing in the spring, and again in the summer, while cod is also fished in the winter-time. The value of the fish, fresh and dried, exported from Norway in 1870, was 7,981,000 sp. d.,* although that year was unfavorable in regard to the returns of deep-water fish. The average annual value of the fish and oil produce is between 9 and 10 millions of sp. d. In 1869 there were 38,000 men employed in the herring fisheries, and the value of the fish for that year was 250,000 sp. d. In the same year 15 Norwegian ships were engaged in the Jan Mayen (70° n. lat.) seal fisheries, when 33,000 young and 29,000 old seals were taken, and the profits of the captures were 45,000 sp. d. Next to the fisheries, Norway derives its greatest sources of wealth from the produce of its woods. In 1870 there were 850,000 tons weight of timber (both deals and unhewn trunks) exported, of the net value of 7,600,000 sp. d. Within the last few years the Norwegian forests have yielded a new product of industry, known as wood-paste, extensively employed in the manufacture of paper, for which it promises to serve as a cheap and efficient substitute for rags.

The fauna of Norway includes the bear, wolf, lynx, elk, otter, reindeer, red-deer, seal, the eider-duck and many other kinds of sea-fowl, blackcock, capercailzie, and a great variety of small game. According to the census of 1875, there were in Norway 151,903 horses, 1,016,617 horned cattle, 1,686,306 sheep, 322,821 goats, 101,020 swine, 96,567 reindeer.

The mineral products, which comprise silver, copper, nickel, cobalt, iron, chrome sulphur, etc., yield a large annual return. Nickel and sulphur have increased lately; the others, especially iron, have fallen off for lack of wood to work them with, the forests having been wastefully destroyed. The richest mines are situated in the south, and chiefly in the district of the Glommen, as the celebrated and ancient silver-works of Kongsberg, the copper mines of Röraas, Alten, and Vigsnæs, the nickel mines of Modum and Bamble, and the cobalt-works of Buskerud, and the numerous iron shafts on the southern declivities of the mountains between Kongsberg and the Glommen. Latterly, however, some productive copper-works have been opened in the northern districts of Kaafjord in Finmark.

Ship-building in all its branches is almost the only industrial art that is extensively and actively prosecuted. In many parts of the country there are absolutely no special trades, the inhabitants of the small fishing-ports, no less than the inmates of the widely separated farms, employing their compulsory leisure during the long winter in weaving, spinning, and making the articles of clothing and the domestic implements required in their households.

Trade, etc.—The principal seats of trade are Christiania, Drammen, Arendal, Bergen, Stavanger, and Trondhjem. The merchant fleet numbered, in 1880, 8,150 vessels of 1,511,000 tons, manned by 59,000 seamen. In 1880, 9,000 vessels cleared the ports of Norway. The exports, which consist mainly of timber, fish, minerals, furs, feathers, and down, amounted in 1873 to 33,987,000 sp. d., or about £7,000,000; while the imports for the same year were 45,859,000 sp. d., or £10,300,000 sterling. The value of the exports to Great Britain in 1883 was £2,998,072, the imports thence being valued at £1,808,283. The imports consist not only of the ordinary colonial goods, and objects of luxury, but in a large proportion of the most necessary articles of consumption, as cereals to the annual amount of 2,000,000 tons, salt in nearly half that quantity, fresh and salted meat, butter, soap, hemp, and flax, sailcloth, tow, oil, wine, tobacco, and manufactured goods of all descriptions. The most important commercial relations of Norway are with Great Britain and Germany. Russia and Denmark stand next in order as importers to Norway, while the Catholic countries of the Mediterranean are the principal purchasers of the smoked and dried Norwegian fish.

Revenue, etc.—By the budget for 1881–82, the revenue was estimated at 43,791,900 kroner (the *krone*, worth 1s. 1½d., having in 1875 superseded the old *specie-daler*), or about £2,432,880, the expenditure being presumed to equal the receipts. The national debt of Norway amounted in 1883 to £5,758,248.

Administration, etc,—Norway is divided into 20 amts, or administrative circles, as given in the table. The circles are subdivided into 56 fogderier (bailiwicks), each presided over by a rural magistrate, and containing in all 446 herreder, or administrative districts, which have similarly their own judicial or official heads. Norway has a representative government, based on the constitution which was established in 1814, and ratified at Eidsvold. The Storthing, or legislative chamber, meets annually, and is composed of representatives who are elected by deputies who have been selected for the

* The specie daler is worth about 4s. 6d.

purpose of nominating the members. These deputies are elected by a system of almost unrestricted universal suffrage, the only qualifications necessary being the attainment of the age of 25, and the possession of property in land to the value of 150 sp. d., or a five years' tenancy of such property. The election of the deputies takes place every third year, when the electors meet in their respective parish churches, and choose deputies, whose number is in the proportion of 1 to 50 voters for towns, and 1 for 100 in rural districts. These deputies then select from their own body, or from among other eligible persons, the representatives for the Storthing, which is further subdivided into two distinct chambers, the Lagthing and Odelsthing, with the former of whom rests the framing legislative and financial measures, and with the latter the power of accepting or rejecting them, and the right of taking cognizance of the conduct of the ministers, judges, and other officers of the state. The members of the Storthing receive an allowance for their time and traveling expenses during the session. The Storthing votes the taxes, which are collected by officers of the king of Sweden and Norway; it proposes laws, which must be ratified by the king; but if they pass the Storthing three times, they acquire validity even without the king's sanotion. Although Norway constitutes one joint kingdom with Sweden in regard to succession, external policy and diplomacy, it is in all other respects an independent state, having its own government, legislative machinery, finances, army, and navy. The king is indeed commander-in-chief of all the forces of the country, whether military or naval; but he can neither augment nor decrease their number, nor proclaim peace or war without the assent of the Norwegian Council of State, which must consist of ten members, natives of the country; nor, excepting in time of war, can he bring foreign soldiers within the frontiers, or send native troops out of Norway. In accordance with the constitution, no title can be conferred independently of the tenure of office, and no one can be raised to the rank of a noble; while with the death of the members of the few still surviving noble families who were born before 1821, all personal honors, privileges, and distinctions belonging to the nobility will cease. The constitution may therefore be regarded as purely democratic in its character. The council of state constitutes the highest court of justice, under whose jurisdiction the provincial magistrates or *amtmaend* administer justice, in conjunction with the bailiffs and *sorenskviver* or advocates, who preside over petty rural courts. These lower courts are controled by the *Stift* or diocesan courts of justice; while the latter are, in their turn, under the high court of appeal, or *Höieste Ret*, located at Christiana. Between 1880 and 1884 there was a fierce constitutional struggle as to the king's power of veto.

Religion, etc.—The Lutheran is the predominant church, to which all persons holding public offices of trust must belong, although freedom is allowed to all other Christian denominations and to Jews. The church is under the administration of six bishops, whose sees are Christiana, Christiansand, Trondhjem, Bergen, Hamar, and Tromsö. There are 80 deaneries, 437 higher rectories, 960 parish and district, town and country churches in all. There were, in 1870, 532 beneficed clergymen, and 337 theological candidates without fixed preferment. The whole number of dissenters in 1875 did not exceed 7,300. The clergy who receive tithes, exercise considerable influence in remote country districts, where they frequently are called upon to settle disputes, and exercise various judicial functions. Much has been done of late years in Norway for the diffusion of knowledge, and provision is now made to extend education to the inhabitants of the most inaccessible districts by means of itinerant teachers, a certain number of whom, corresponding to the number of farms in each parish, are nominated to the office of schoolmaster. These men proceed from house to house, being supplied with a schoolroom, and fed and entertained by each householder in succession for the number of days at which the farm is mulcted; and by the aid of these means, education is so universally diffused that it is rare to meet with Norwegians who cannot read and write. In 1869 there were 150 higher poor schools, 15 normal schools for the parish-school teachers, 96 higher private schools, 15 military, naval, and navigation schools, and 12 polytechnic institutions. The expenses incurred for education were, for the country districts, 365,000 sp. d., and for the towns, 111,367 sp. d. The university of Christiania (q.v.). which was founded in 1811, has 47 professors, and is attended by about 1000 students, amongst whom are the sons of many of the peasant land-owners, who receive a university education without intending to follow the learned professions. Education is compulsory on children between 7 and 14.

Army, etc.—By the terms of the laws of 1866 and 1876, the army of Norway is composed of troops of the line, the military train, the militia or Landevaern, the civic guards, and the Landstorm, or final war levy. In 1882 the troops of the line numbered 40,000 men and 760 officers. All young men above twenty-one years of age, are liable to serve, with the exception of the inhabitants of the three northern amts of the kingdom. The fleet numbered, in 1882, 88 vessels, of which 37 were steamers, carrying 152 guns. The navy was manned by 1,400 sailors, but the number of men liable by law to be called upon for naval service in the districts of Norway exceeds 26,000. Horten, in Christiana-Fjord, is the principal naval port. The only fortified spots are Frederickssteen at Frederickshald, Frederickstad, Akershuus, Bergenshuus, Munkholm, and Vardöhuus.

The population of Norway is chiefly rural, only about 11 per cent living in towns. Christiana, the principal city, has 77,000 inhabitants, while Bergen and Trondhjem

have respectively only 34,000 and 22,500. The physical character and consequent climatic relations of Norway leave a very small proportion (according to some writers, only about 2 per cent) of the area capable of being cultivated. There are few villages, and the isolated farmsteads are often separated from one another by many miles. The cultivators of the land are in most instances also the proprietors, less than one-third of the whole number being tenants only. Allodial land, known as Udal or Odel, does not descend to the eldest son unconditionally, since all his relatives have a claim upon it, and if it should be sold, have the right of buying it back within the term of five years at the sale-price. There were 20,212 emigrants to America in 1880.

Roads, Railways, etc.—The public roads in Norway are excellent; and traveling is rendered cheap and expeditious by the system established and regulated by law, in accordance with which carriages and horses are provided at fixed rates of payment for travelers passing through the rural districts of the country. This system, which is known as "Skyds," is completely under the control and direction of the authorities, by whom the number of the guest-houses and stations are regulated. The length of the railways in Norway in 1882 was about 950 m.; and the number of letters that passed through the post in 1881 was 15,545,000.

Race, Language, etc.—With the exception of some 20,000 Lapps and Finns, living in the most remote northern regions, the inhabitants of Norway are generally a pure Scandinavian race, akin to the North German nations of Aryan descent. The genuine Norwegians are of middle height, with strong, well-knit, muscular frames, of fair skin, with light flaxen or yellow hair, and blue eyes. In character, they may be said to be frank, yet cautious and reserved, honest, religious, and superstitious, more from an inveterate love of clinging to the forms, thoughts, and creed of their ancestors, than from fanaticism. Their love of country, and the irrepressible fondness for the sea, by the very anomaly which these apparently contraditory propensities exhibit, show them to be the true descendants of the sea-roving Northmen of old. Of late years emigration has continued steadily to increase at a rate which threatens to be a serious evil to so badly populated a country as Norway, but which is easily explained by the small portion of land capable of cultivation. The general diffusion of education, and the perfect equality and practical independence which they have known how to secure and to retain themselves, notwithstanding this nominal incorporation with the other Scandinavian kingdoms, give to the poorest Norwegians a sense of self-respect and self-reliance which distinguish them favorably from those of the same class in other countries. The peasants, more especially in the amts remote from towns, retain their ancient provincial costumes, which are, for the most part, highly picturesque, consisting among the women, of ample woolen skirts and brightly-colored knit bodices, fastened and adorned with silver or brass clasps and buckles. Music is much cultivated by all classes of the people, and the national songs and melodies which are the favorites, are for the most part of a melancholy character.

Danish is the language in ordinary use both in writing and speaking, although dialects near akin to the old Norse are spoken by the dalesmen and mountaineers of special districts. Since the separation of the country from Denmark, a strongly national tendency has been manifested by some of the best Norwegian writers, and attempts have been made to reorganize these dialects into one general Norwegian language, and thus, in fact, to revive the ancient Norse, or Icelandic, which has been preserved in Iceland in almost perfect purity since its introduction to the island in the 9th c. by colonists from the Scandinavian mother-lands. Among the most zealous cultivators of the ancient and modern literature and history of Norway, we may instance Prof. P. A. Munch, whose able expositions of the laws and social conditions of his country have thrown new light on its history; Keyser, Unger, and Holmboe, who have done much to elucidate the Norse tongue and literature; A. Munch, Bjerregaard, Hansen, and Welhaven the critic, successful cultivators of the national lyric; J. Moe and Asbjörnsen collectors and annotators of native sages; Ibsen the dramatist, and Björnsen the delineator of national peasant life. In the more abstruse departments of mathematical and physical science, Norwegians have gained for themselves a foremost place, as is sufficienty testified by the mention of names such as N. H. Abel, renowned for his discoveries in indefinite integrals; C. Hansteen, the astronomer; and Keilhau, the geologist.

History.—The early history of Norway is comprised in that of the other Scandinavian countries, and is, like theirs, for the most part fabulous. It is only towards the close of the 10th c., when Christianity was introduced under the rule of Olaf I., that the mythical obscurity in which the annals of the kingdom had been previously plunged begins to give place to the light of historical truth.

The introduction of Christianity, which was the result of the intercourse which the Norwegians had with the more civilized parts of Europe through their maritime expeditions, destroyed much of the old nationality of the people with the heathenism which they had hitherto cherished, although the sanguinary feuds which had raged among the rival chiefs of the land can scarcely be said to have lost their ferocity under the sway of a milder religion. Olaf II., or the Saint (1015–30), who zealously prosecuted the conversion of his countrymen, raised himself to supreme power in the land by the subjection of the small kings or chieftains, who in the times of heathenism had subdivided the kingdom among them. The war between Olaf and King Knud the Great of Denmark,

which terminated in 1030 with the battle of Stricklestad, in which the former was slain, brought Norway under the sway of the Danish conqueror; but at his death in 1036, Olaf's son, Magnus I., recovered possession of the throne, and thenceforth, till 1319, Norway continued to be governed by native kings. The death in that year of Hakon V. without male-heirs, threw the election of a new king into the hands of the national assembly, who, after many discussions, made choice of Magnus VIII. of Sweden, the son of Hakon's daughter. He was in turn succeeded by his son Hakon, and his grandson Olaf IV., who having been elected king of Denmark in 1376, became ruler of the sister Scandinavian kingdoms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother queen Margaret, the only child of Valdemar III. of Denmark, died without heirs in 1387. Margaret's love of power and capacity for government brought about her election to the triple throne of the Scandinavian lands, and from this period till 1814, Norway continued united with Denmark; but while it shared in the general fortunes of the latter state, it retained its own constitutional mode of government, and exercised its right of electing to the throne, until, like the sister-kingdom, it agreed of its own free will to relinquish this privilege in favor of hereditary succession to the throne. See DENMARK, HISTORY OF. The Napoleonic crisis may be said to have severed this union, which had existed for more than 400 years, for Denmark, after having given unequivocal proofs of adhesion to the cause of Bonaparte, was compelled, after the disastrous war of 1813, to purchase peace at the cost of this long united partner of her state. Crippled in her resources, and almost bankrupt, she saw herself constrained to sign the treaty of Kiel in 1814, by which it was stipulated by the allied powers that she should resign Norway to Sweden, receiving in return, by way of indemnity, some portion of Swedish Pomerania and the island of Rügen, which were subsequently exchanged with Prussia for Lauenburg on the payment by that state of two million rix-dollars. The Norwegians, having refused to admit the validity of the treaty of Kiel, nominated Prince Christain, the heir-presumptive to the throne of Denmark, regent and subsequently king of Norway, The nomination was made by the national diet, or storthing, which met at Ejdsvold, where they drew up a constitution based on the French constitution of 1791. These measures found, however, neither supporters nor sympathizers among the other nations; and with the sanction of the great allied powers, Charles John Barnadotte, crown-prince of Sweden, led an army into Norway, and after taking Frederickstad and Frederickshald, threatened Christiania. Denmark being unable to support the cause of prince Christian, and Norway being utterly destitute of the means necessary for prosecuting a war, resistance was of no avail, and the Norwegians in this untoward conjuncture of affairs, were glad to accept the proposals made to them by the Swedish king for a union with Sweden, on the understanding that they should retain the newly promulgated constitution, and enjoy full liberty and independence within their own boundaries. These conditions were agreed to, and strictly maintained; a few unimportant alterations in the constitution, necessitated by the altered conditions of the new union, being the only changes introduced in the machinery of government. Charles XIII. was declared joint king of Sweden and Norway in 1818, and while the latter has become an almost independent state, it is questionable whether the former has found in its nominal acquisition an equivalent for the loss of Finland, which was the price exacted for it by the allied powers, and made over to Russia. Since the union, Norway has firmly resisted every attempt on the part of the Swedish monarchs to infringe upon the constitutional prerogatives of the nation; and during the reign of the first Bernadotte dynasty, the relations between him and his Norwegian subjects were marked by jealousy and distrust on both sides; but, since his death, the people generally have been more contented, and Norway has continued to make rapid progres towards a state of political security and material prosperity far greater than it ever enjoyed under the Danish dominion.—See T. Thorlak, *Historia rerum Norvegicaram* (Copenh. 1711); Schöning, *Noryes Riges Historie* (Soroe, 1771); Munch, *Det Norske Folk's Historie,* vols. 1 to 8 (Christ. 1852–63); *Bridrag til Norges Officiela Statistik,* 1871.

NORWAY HADDOCK. See BERGYLT.

NORWEGIAN LANGUAGE AND LITERATURE (NORWAY, *ante*). The great Teutonic stem divides at about the time of the invasion into four dialects; but whether these dialects antedate the year 500 A.D. is very doubtful. The Gothic of Ulfilas is, undoubtedly, the oldest; but the Saxon follows not long after. The high German, by the testimony of charters, only begins after the battle of Tolbiac (Zuelpich). The Norwegian, if by this we understand the *Izlendska tunga* (Icelandic), though at most of the 12th c. represents a dialect at least 100 years earlier, and allows us to supply missing Gothic forms better than any other. Perhaps its great changes may be referred to the 8th c.; and they are greater than those of either Saxon, or high German. They are: (*a*) great contraction and assimilation; (*b*) dropping of case-endings; (*c*) dropping of prefixes; (*d*) an harmonious system of vowels, but accomplished by umlaut and reflex, more like Saxon than German; (*e*) assimilation of vowels; (*f*) the suffixed article; (*g*) w before r, l, and u is dropped; (*h*) j initial dropped; (*i*) w is vocalized. The real test is the introduction of new terms, as georwa, Scotch gar, and taka, take, replace, thuwa, do, and nimma, niman, Ang.-Sax. Also, at, ok, replace, ettu, ekende, to, and. About 1120 A.D. lived Thorodd, the

grammarian; and in his time certain changes had already taken place in a contraction which involved the loss of *n* final in verbs and in weak nouns. He specifies vowels, *a* short, as in father; *a* long (an) as in hall; *æ* short, as in man; *æ* long, as in were; *e* short, as in red; *e* long, as in they; *i* short, as in it; *i* long, as in sweet; *o* short, as in not; *o* long, as in row; *u* short, as in foot; *u* long, as in food; *y* short, as in une (French), kuechen (German), *y* long, as in duke, nieuw (Dutch); *œ* short, as in hurt; *œ* long, as in earth; *eo* short, as in seuil (French); *eo* long, as in boy. Three diphthongs—*au*, *ei*, and *ey*—all with a distinct sound for each letter as above. Every vowel could be nasalized. *B*, *p*, *m*, *n*, *k*, *l*, *t*, and *d* as in English; *c* and *g* always hard; *s* always sharp; *r* always trilled; *f* initial, *f*; *f* medial and final, *v*; *v* initial, *v*; *v* medial, *w*; *i*=English *y*; *th* initial, elsewhere, *dh*. There was a sign for *ng*, *hr*, *hn*, *hl*, like our *when* =hwen. Double consonants kept separate, and, after the discontinuance of nasal vowels, *dhr*=*ndhr*; *br*=*mbr*; *llr*=*ldr*; short vowel and *d*=*nd*; short vowel and *k* or *g*=*nk*, *ng*. In short the rule seems to be pronunciation clear, and rather slow; words and phrases cut as short as possible. Accent on first, if not, on root syllable. Quantity entirely by accent. At the end of the 13th c. ensued a change of pronunciation and spelling; and in the 16th c. a whole new series of changes in pronunciation, making the language like modern English—spelled, not pronounced. The MS. was the Lombard; that is, Anglo-Saxon or Irish, gradually changing, as with us, to Gothic. Modification of words had been accomplished in vowels by (*a*) *umlaut*, as in Gothic, and more in Saxon; (*b*) *reflection* by *i*=*y*, and *v*=*w* from the next syllable. As in English these changes had been taken advantage of to show difference of meaning, as falla, to fall, and fella, to fell. This also liquidizes—the commonest sign of the language—all broad vowels, when a corresponding termination has dropped. Fjarr, Eng. far, fjodhr, feather, etc. Changes in consonants are (*a*) *assimilation*: *np*=*pp*, happ (*hap.*); *nk*=*kk*–drikka (drink) *nt* or *ndt*=*tt*, vettr (winter); *nth*=*nn*—sannr (south); *lth*=*ll*—gull (gold); *rd* (*zd*)=*dd*—odd (point); *rn* (*zn*)=*nn*—rann (house) ran (sack); *nnr* (*dnr*)=*dhr*—fidhr (finds). (*b*) *Inflection*: *lr* (*lz*)=*ll*.—gamall (old); *nr* (*nz*)=*nn*—steinn (stone); *sr*=*ss*—iss (ice); *dhd* =*dd*—faedda (fed); *dht*=*lt* gótt (good). Alone of all Indo-European languages (since the formation of case), it suffixes the article, and that to both noun and article, and the independent adjective has best preserved the old forms. There is a strong declension of nouns, *r* taking the place of *s* and a weak declension, but German *n* dropped already. Comparison much as in English: illr (ill); verri (worse); verstr (worst). Numerals between Saxon and Danish. Pronouns: *ek* (I), thú (thou); hann (he), hon (she); vit (we two) thit (ye two); vér (we); thér (ye); their (they, men); thaer (they, women); thau (they, things). Verbs have two tenses, present and past, other by help verbs, as in English: and four moods—indicative, subjunctive, imperative, and infinitive. Strong and weak verbs as in German and Saxon, and, as in English, the strong are becoming weak. It has a peculiar form. The reflexive is formed by adding *z* to verb, or *sék* as a pronoun. Adverbs vary between English and German. Adjectives are formed for the most part with terminals not found in English. The grammar is particularly noticeable for what may be called close contact in the parts of a sentence, for impersonal and reciprocal verbs, for prepositional verbs, with a different meaning as in English and Russian, and the use of the dative of near definition. Of the earliest works Heims-Kringla still shows traces of poetic arrangement; but the language can only be judged by Kormak's saga, rather antiquated, and by Laxdaela, and Niala, the latter heroic in brevity and pithiness. The poetry, though formed on some extinct model, which must have served for all the early memory, rhymes of the Indo-European races, having the additional advantage of alliteration, and later of rhyme, seldom it rises to the height of Eirik Blood-Axe's death-song; and for the most part it is a mere convolution of stereotyped allusions and forced alliterations.

NORWEGIUM, a metallic element discovered by Teleff Dahll, in copper-nickel from Kragaro in Skjaergaarden, Norway. The color of the pure metal is white, with a slight brownish cast. When freshly polished it has a perfect metallic luster, but after a time becomes covered with a thin film of oxide. In hardness it resembles copper. One oxide N_2O, has so far been obtained. A brown sulphide is formed by treatment with sulphureted hydrogen, which redissolves in ammonium sulphide. Solution in hydrochloric acid, green; in nitric acid, blue; and in sulphuric, colorless.

NORWICH, a city of Connecticut, at the head of navigation of the Thames river, 13 m. n. of New London, and 38 s.e. of Hartford. The chief portion of the city lies on an eminence that rises between the Yantic and Shetucket rivers, which here unite to form the Thames. There are numerous manufactories of cotton, wool, paper, etc., which are supplied with water-power by falls of 50 ft. on the Yantic river. Norwich contains county buildings, 7 banks, 1 daily and 3 weekly papers, 16 churches, 40 public and 5 private schools, and a free academy. Norwich was settled in 1569, when 9 sq.m. were bought for £70 of Uncas, an Indian chief, whose grave is in the city. Pop. '70, 16,653.

NORWICH (*ante*), semi-capital of New London co., Conn.; situated on the Norwich and Worcester, and the New London Northern railroads, connected with New York by a line of large steamboats; pop., '80, 21,141. The town is built upon a series of terraced hills, and in the valleys of the Shetucket and Yantic, which here uniting form the Thames. There are a court house, 10 banks, 2 daily and 2 weekly papers, a public

library, high school, and the Norwich Free academy, which has a very high reputation as a training school for college. Water power is obtained from the tributaries of the Thames and the variety of manufactures is very great, including cotton and woolen goods, paper, machinery, rubber articles, pistols, envelopes, iron, and machinery The increase in population since 1870 has been about 6,000; indicating that the business prospects of the town are excellent. Main street is the principal business thoroughfare, and Broadway and Washington streets are among the most beautiful of those occupied by private residences. There are many fine public buildings, handsome dwellings, and ornamental grounds; and the city is noted for picturesque beauty.

NORWICH, a t. the co. seat of Chenango co., Yew York, pleasantly situated on the Chenango river and canal, and the Delaware, Lackawanna, and Western, and New York and Oswego Midland railroads; 90 m. w. of Albany; pop. '80, 5,756. It has a stone court-house, an academy, 8 churches, 2 banks, and 2 weekly newspapers. Among the articles manufactured are carriages, pianos, hammers, leather, and machinery.

NORWICH, a city of England, capital of the co. of Norfolk, and a co. in itself, on the Wensum, immediately above its confluence with the Yare, 20 m. w. of Yarmouth, and 98 m. n.n.e. of London. It covers an area about 5 m. in circumference, is skirted on its n, and e. sides by the river, and on the w. and s. it was formerly surrounded by walls, the last vestiges of which have been recently removed in order to make room for the extension of the city. The market-place (600 ft. long by 340 ft. wide) and its vicinity contain many large shops and good houses. The castle, finely situated on an elevation near the center of the town, originally covered, with its works, an area of about 23 acres. The bridge (150 ft. long) over the ditch has one of the largest and most perfect Anglo-Norman arches remaining. The massive quadrangular Norman keep is now used as a prison. The cathedral, almost wholly Norman in plan, was founded in 1094 by bishop Herbert Losinga. It is 411 ft. long, 191 ft. broad at the transepts, and is surmounted by a spire 315 ft. high. Near the cathedral are a number of ancient and interesting structures now more or less in ruins, among which may be mentioned St. Ethelbert's and the Erpingham gate, the former in decorated English, the latter in late perpendicular, and both valuable and rich specimens of their styles. Besides a large number of dissenting chapels and other places of worship, there are about 40 churches, of which St. Peter's, Mancroft, a handsome cruciform edifice of the 15th c., with a remarkably fine peal of 12 bells; St. Andrew's, St. Clement's, St. George's, St. Giles, St. Michael's, and others, are worthy of mention. The Free Grammar school, with an endowment of about £200 a year, was founded by Edward the VI., and the other educational establishments are numerous and various in character. The public library contains 20,000 volumes, and the library of the Norwich literary institution, 15,000 volumes. Norwich is the seat of extensive and flourishing manufactures, the chief of which are bandanas, bombazines, shawls, crapes, gauzes, damasks, camlets, and muslins; shoemaking is extensively carried on, yarn and silk mills are in operation, and employ many hands. Iron-founding, dyeing, malting, etc., and agricultural implement-making, are also carried on. The trade, which is facilitated by a canal and river system of communication with the sea, is chiefly in agricultural produce and coal. Norwich is the see of a bishop, and returns two members to parliament. Pop. of municipal and parliamentary borough in '81, 87,843.

About 3 m. s. of Norwich is Castor St. Edmunds, which, prior to the Roman era, was called Caister, and under the Romans received the name of *Venta Icenorum.* Norwich occupies a place in history from the time of the earlier Danish invasions, had its origin in the castle erected as a stronghold by the East Anglian kings, and resorted to as a place of safety by the inhabitants of *Venta Icenorum,* who gave it the name of North-wic, or northern station or town, on account, of its relative postion with respect to their own town. The bishopric of the East Angles was removed hither in 1094. About 4,000 Flemings settled at Norwich in the reign of Elizabeth, and greatly increased the prosperity of the town by the branches of manufacture which they introduced.

NORWICH CRAG, or Mammaliferous Crag, a series of highly fossiliferous beds of sand, loam, and gravel, of Pleistocene age, occurring at several places within a few miles of Norwich, where they are popularly named "crag." They contain a mixture of marine and fresh-water mollusca, with ichthyolites and bones of mammalia. They are evidently estuary beds, the most common shells being the very species now abundant in such situations around the coasts of Britain; but with them are associated a few extinct species. The beds rest on the white chalk, the surface of which is frequently perforated by *pholas crispata,* the shell still remaining at the bottom of the cavity. The mammalian bones belong to species of elephant, horse, pig, deer, and field-mouse. With them are occasionally found the bones of *mastodon angustidens* and some mollusca, which belong to the red crag. Their occurrence here is believed to have arisen from their having been washed out of the Red into this, the Norwick crag.

NORWOOD, Upper and Lower, are two villages in Surrey, England, with a station on the London and Croydon railway, 6 m. s. of London. The public pleasure-ground, called the Beulah Spa, is prettily laid out around a mineral spring. The villages are worthy of mention, however, chiefly on account of their schools, among which are a district school for the pauper children of Lambeth parish, and a very large and important educational

establishment for the pauper children of London. The district parish of Norwood had, in 1871, a population of 12,536.

NORWOOD, THOMAS MANSON. See page 891.

NOSE, AND THE SENSE OF SMELL. The nose is not only the organ of smell, but is likewise a part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an external part—the projecting portion, to which the term *nose* is popularly restricted; and an internal part, consisting of two chief cavities, or *nasal fossæ*, separated from one another by a vertical septum, and subdivided by spongy or turbinated bones projecting from the outer wall into three passages or *meatuses*, with which various cells or *sinuses* in the ethmoid, sphenoid, frontal, and superior maxillary bones communicate by narrow apertures.

The external portion of this organ may be described as a triangular pyramid which projects from the center of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the *nostrils*, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (*vibrissæ*), which project across the openings, and serve to arrest the passage of foreign substances, such as dust, small insects, etc., which might otherwise be drawn up with current of air intended for respiration. The skeleton, or framework of the nose, is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed sesamoid cartilages; there is also the cartilage of the septum which separates the nostrils, and in association posteriorly with the perpendicular plate of the ethmoid, and with the vomer, forms a complete partition between the right and left nasal fossæ. It is the lower lateral, termed by some writers the alar cartilage, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles, which it is unnecessary to describe. The integument of the nose is studded with the openings of sebaceous follicles, which are extremely large and abundant in this region. The oleaginous secretion of these follicles often becomes of a dark color near the surface; and hence the spotted appearance which the tip and lower parts of the sides, or *alæ*, of the nose frequently present. On firmly compressing or pinching the skin of these parts, the inspissated secretion is forced out of the follicles in the form of minute white worms with black heads.

The *nasal fossæ*, which constitute the internal part of the nose, are lofty, and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and and near the orifices of the eustachian tubes, which proceed to the tympanic cavity of the ear.

The mucuous membrane lining the nose and its cavities is called *pituitary* [Lat. *pituita*, slime, rheum), from the nature of its secretion; or *Schneiderian*, from Schneider, the first anatomist who showed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see EYE), and with that of the pharynx and middle ear posteriorly. This membrane varies in its structure in different parts of the organ. On the septum and spongy bones bounding the direct passage from the nostrils to the throat, the lining membrane is comparatively thick, partly in consequence of a multitude of glands being disseminated beneath it, and opening upon it, but chiefly, perhaps, from the presence of ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs. They also serve to explain the tendency to hemorrhage from the nose in cases of general or local plethora. In the vicinity of the nostrils, the mucous membrane exhibits papillæ and a sealy epithelium, like the corresponding parts of the skin, In the sinuses, and in all the lower region of the nose, the epithelium is of extreme delicacy, being of the columnar variety, and clothed with cilia. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the *olfactory region*—the epithelium ceases to be ciliated, assumes a more or less rich sienna-brown tint, and increases remarkably in thickness, so that it forms an opaque soft pulp upon the surface. It is composed of an aggregation of nucleated particles, of nearly uniform appearance throughout, except that the lowest ones are of a darker color than the rest, from their containing a brown pigment in their interior. Dr. Todd and Mr. Bowman remark, in their *Physiological Anatomy*, from which we have condensed the above account of the nasal mucous membrane, that the olfactory region abounds in glands, apparently identical with sweat glands, which dip down in the recesses of the submucous tissue among the ramifications of the olfactory nerve.

The nerves of the nose are the first pair or olfactory which are specially connected with the sense of smell, branches of the fifth pair which confer ordinary sensibililty on

its skin and mucous membrane, and motor filaments, from the facial nerves to the nasal muscles. The olfactory nerve on each side is connected with the inferior surface of the brain (q.v.) by an external, a middle, and an internal root, which unite and form a flat band (or, more correctly, a prism), which, on reaching the cribriform plate of the ethmoid bone, expands into an oblong mass of grayish-white-substance, the *olfactory bulb*. From the lower surface of this bulb are given off the *olfactory filaments*, fifteen or twenty in number, which pass through the cibriform foramina, and are distributed to the mucous membrane of the olfactory region. These filaments differ essentially from the ordinary cerebral nerves. They contain no white substance of Schwann, are not divisible into elementary fibulæ, and resemble the gelatinous fibers in being nucleated, and of a finely granular texture. The branches of the fifth pair (or trifacial) given to the nose are the nasal nerve (derived from the ophthalmic division), which supplies the skin and mucous membrane in the vicinity of the nostrils, and the naso-palatine nerve (derived from Meckel's ganglion, which is connected with the superior maxillary division), which supplies the mucous membrane on the spongy bones and on the septum. The peculiar sensation that precedes sneezing is an affection of the nasal nerve, and the flow of tears that accompanies a severe fit of sneezing is explained by the common source of this and the lachrymal nerve; while the common sensibility of the nose, generally, is due to the branches of this and of the naso-palatine nerve.

The nature of odorous emanations is so little known, that it is impossible to give a definite account of the mode in which they produce sensory impressions. From the fact that most odorous substances are volatile, and *vice versâ*, it may be presumed that they consist of particles of extreme minuteness dissolved in the air; yet the most delicate experiments have failed to discover any loss of weight in musk, and other strongly odorous substances, after they have been freely evolving their effluvia for several years. But whatever may be the nature of the odorous matter, it is necessary that it should be transmitted by a respiratory current through the nostrils to the true olfactory region, whose membrane must be in a healthy condition. If it is too dry, or if there is an inordinate excretion of fluid from its surface (both of which conditions occur in catarrh or cold in the head), smell is impaired or lost, in consequence of the necessary penetration of the stimulating odor to the nervous filaments being prevented.

The acuteness of the sense of smell is far greater in many of the lower animals (dogs, for example) than in man, and they employ it in guiding them to their food, in warning them of approaching danger, and for other purposes. To civilized men its utility is comparatively small; but it is occasionally much increased when other senses are deficient. In the well-known case of James Mitchell, who was deaf and blind from his birth, it was the principal means of distinguishing persons, and enabled him at once to perceive the approach of a stranger. Amongst many savage tribes the sense is almost as acute as in many of the lower mammals. For example, the Peruvian Indians are able, according to Humboldt, to distinguish, in the middle of the night, whether an approaching stranger is a European, American Indian, or Negro,

Although all poisonous gases are not odorous, and all bad odors may not be positively deleterious to health, there can be no doubt that one of the principal objects for which the sense of smell is given to us is to enable us to detect atmospheric impurities, many of which are of a most noxious character, and give rise to the most serious forms of fever.

NOSE-RING. See Ring.

NOSING, the projecting edge of a molding, such as the bead or bottle used on the edge of steps, to which the term is most frequently applied.

NOSOL′OGY (Gr. *nŏsŏs*, disease) is that branch of the science of medicine which treats of the distribution and arrangement of diseases into classes, orders, etc. Many systems of nosology have at different times been adopted; some of which have been based upon the nature of the ascertained causes of diseases; others on the pathological states or conditions which attend diseases; others on the differences between structural and functional diseases, etc. It is hard to say which is the most perfect method; but that of Dr. Farr, one of the most distinguished living medical statists, is adopted by the registrar-general in the reports on the mortality of London and England, and is becoming more generally adopted than any other. It has the advantage over the antiquated but once popular system of Cullen (1792) of meeting the requirements of modern science, and (by illustrating great questions connected with public health) of showing those causes that are injurious or fatal to life, and of thus contributing to the removals of those evils (bad drainage, imperfect ventilation, etc.) which tend to shorten human existence.

We append Dr. Farr's system of nosology, which is arranged in four primary classes, each of which includes various orders:

Class I. Zymotic Diseases (Gr. *zymē*, a ferment).—Diseases that are either epidemic, endemic, or contagious, and that are induced by some specific body, or by want of food or by its bad quality. In this class there are four orders—viz., Order I. *Miasmatic Diseases* (Gr. *miasma*, a stain), such as small-pox, measles, scarlet-fever, diptheria, typhus and typhoid fevers, cholera, ague, etc. Order II. *Enthetic Diseases* (Gr. *enthĕtos*, put in or implanted), such as syphilis, gonorrhœa, glanders, hydrophobia, malignant pustule, etc. Order III. *Dietic Diseases* (Gr. *diaita*, way of life or diet), such as famine, fever,

scurvy, purpura, rickets, bronchocele, delirum tremens, etc. Order IV. *Parasitic Diseases*, such as scabies (or itch), and worm disorders from animal parasites and ringworm, scald-head, etc., from vegetable parasites or fungi.

Class II. Constitutional Diseases.—Diseases affecting several organs, in which new morbid products are often deposited; sometimes hereditary. This class contains two orders. Order I. *Diathetic Diseases* (Gr. *diathĕsis*, condition or constitutional), including gout, anæmia, cancer, melanosis, lupus, etc. Order II. *Tubercular Diseases*, such as scrofula, phthisis, mesenteric, tubercular meningitis, etc.

Class III. Local Diseases.—Diseases in which the functions of particular organs or systems are disturbed or obliterated with or without inflammation; sometimes hereditary. This class includes eight orders. Order I. *Brain Diseases* (or more correctly, *Diseases of the Nervous System*), such as apoplexy, paralysis, epilepsy, chorea, hysteria, mania, etc. Order II. *Heart Diseases* (or more correctly, *Diseases of the Circulatory System*), such as pericarditis, endocarditis, aneurism, angina pectoris, atheroma, phlebitis, varicose, etc. Order III. *Lung Diseases* (or more correctly, *Diseases of the Respiratory System*), such as bronchitis, pneumonia, pleurisy, asthma, empyema, laryngitis, etc. Order IV. *Bowel Diseases* (or more correctly, *Diseases of the Digestive System*), such as stomatitis, gastritis, enteritis, peritonitis, jaundice, etc. Order V. *Kidney Diseases*, such as Bright's disease, nephritis, ischuria, diabetes, stone, gravel, etc. Order VI. *Genetic Diseases* (or *Diseases of the Generative System*). such as hydrocele, ovarian dropsy, etc. Order VII. *Bone and Muscle Diseases*, such as caries, necrosis, exostosis, synovitis, muscular atrophy, etc. Ordor VIII. *Skin Diseases*, such as urticaria, eczema, herpes, impetigo, acne, lichen, prurigo, etc.

Class IV. Developmental Diseases.—Special diseases, the incidental result of the formative, reproductive, and nutritive processes. It contains four orders. Order I. *Developmental Diseases of Children*, such as malformations, idiocy, teething, etc. Order II. *Developmental Diseases of Women*, such as amenorrhea, childbirth, change of life, etc. Order III. *Developmental Diseases of Old People*, such as old age, and its concomitant affections. Order IV. *Diseases of Nutrition*, such as atrophy, debility, etc.

NOSSI-BE, NOSSI-BARIN, VARIOU-BE or **HELLEVILLE**, an island on the n.w. coast of Madagascar, at the mouth of the bay of Pasoandava, and separated from the main land by a narrow channel. It is about 74 sq.m. in extent; its coast-land is very much indented; and its surface much diversified. The highest hill is 1700 ft. in height, and is clothed to the summit with magniffcent trees; but much of the island has a bare aspect, the forest having been cut down in order to the cultivation of rice. The soil is very fertile, and rice, maize, manioc, bananas, etc., are produced far beyond the wants of the inhabitants. The soil is volcanic, and there are several old craters filled with water. Nossi-Bé has been in the hands of the French since 1840, and is regarded by them as an important possession, on account of an old claim which they suppose themselves to have to Madagascar. There is on this island a small town called Helleville, with a harbor well sheltered from the north and east winds. There is good anchorage also at several other parts of the coast. The population of the island is about 6,000.

NOSSIIBRAHIM, or Sainte Marie, an island on the e. coast of Madagascar, and separated from it by a strait of about 5 m. in width. It is about 40 m. in length from n.n.e to s.s.w., but only a few miles in breadth. It is one of the much-prized possessions of the French on the coast of Madagascar, has been in their lands since 1750, and is their chief place of commerce on that coast. The soil is generally arid, and the climate moist and unhealthy. Rain is of extreme frequency. The population of the island is about 5,000. It contains a small town called Saint Louis—a seaport, and fortified. All the French possessions on the coast of Madagascar were placed by an imperial decree of 1851 under one government, that of the Comoro Isle (q.v.).

NOS'TOC, a genus of plants of the natural order *Algæ*, suborder *Confervaceæ*, found upon moist ground, rocks near streams, etc., and consisting of a somewhat gelatinous hollow tumid frond, filled with simple filaments resembling strings of beads. *N. commune* is frequent in Britain, springing up suddenly on gravel-walks and pasture-grounds after rain. It is a trembling gelatinous mass, often called Star Jelly, and vulgarity regarded, owing to the suddenness with which it makes it appearance, as having fallen from the skies, and as possessed of important medicinal virtues. *N. edule* is employed in China as an article of food.

NOSTRADAMUS, a celebrated astrologer of the 16th c., b. Dec. 14, 1503, at St. Remi, in Provence. His proper name was Michel Notre-Dame, and he was of Jewish descent. He studied first at the collége d'Avignon, where he exhibited remarkable scientific powers, and subsequently attended the celebrated school of medicine at Montpellier. Here he first acquired distinction during an epidemic that desolated the s. of France, by his humane attention to those stricken by the pestilence. After taking his degree, he acted for some time as professor, but was induced by his friend J. C. Scaliger to settle in Agen as a medical practitioner. After traveling for some time, he finally settled at Salon, a little town situated in the environs of Aix, about 1544. Already he must have been reckoned a man of note, for in the following year, when an epidemic was raging at Lyon, he was solemnly invited thither by the civic authorities, and is said to have rendered immense services. He first fell upon his prophetic vein about the year 1547, but

in what light he himself regarded his pretensions, it is now impossible to say. At any rate, he commenced to write his famous predictions (*Prophéties*) which first appeared at Lyon in 1555. The predictions were in rhymed quatrains, divided into centuries, of which there were seven; the 2d ed., published in 1558, contained ten. Astrology was then the fashion, and these quatrains, expressed generally in obscure and enigmatical terms, had a great success. Some, indeed, regarded the author as a quack, but the great majority as a genuine seer or predicter of the future. He was, consequently, much sought after by all sorts of people, high and low. Catherine de'Médicis invited him to visit her at Blois, to draw the horoscope of her sons, and on his departure loaded him with presents. The duke and duchess of Savoy went to Salon expressly to see him; and when Charles IV. became king, he appointed Nostradamus his physician-in-ordinary (1564). He died at Salon, July 2, 1566. Nostradamus's predictions have been the subject of an immense amount of illustrative and controversial literature. He also wrote an Almanac, which served as the model of all subsequent ones, containing predictions about the weather.—See Jaubert's *Vie de M. Nostradamus, Apologie et Historie* (Amst. 1656); Astrue's *Mémoires pour servir à l'Histoire de la Faculté de Montpellier* (Paris, 1767); *Apologie pour les Grands Hommes Soupçonnés de Magie* (Paris, 1825); and E. Bareste's *Nostradamus* (Paris, 1842).

NOSTRILS, Diseases of the. Acute inflammation of the nasal mucous membrane is a very common and well-known affection, which has been already described under the title of catarrh (q.v.), or cold in the head; while the chronic form of inflammation is described in the article Ozœna. Hemorrhage from the nostrils, or *Epistaxis* (Gr. a dropping), is by far the commonest form of bleeding from a mucous membrane. It may be produced (1) by direct injury, as by a blow on the nose, or a scratch in the interior of the nostrils; or (2) it may be an *active* hemorrhage, in which case it is often preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, and flushing of the face (these symptoms are, however, seldom all present in the same case, and not unfrequently the flow of blood is preceded by no apparent disorder); or (3) it may be of a *passive* character, and may be due either to a morbid condition of the blood, as in malignant scarlatina, typhoid and typhus fevers, scurvy, purpura, etc., or to obstruction of the circulation by disease of the liver and heart.

If the hemorrhage occur in a flushed plethoric subject, and is obviously of an active character, it may be regarded as a salutary effort of nature, and may be left alone till it ceases spontaneously; but if it continues so long as materially to weaken the patient, or if it be of the passive character, or if it arise from injury, then means should be taken to stop it with as little delay as possible. The patient should be placed in the sitting posture at an open window, with the head erect or slightly inclined backwards, and amongst the simpler means to be first tried, are compression of the nostrils by the fingers, the application of a key or other piece of cold metal to the back of the neck, and the occasional immersion of the face or whole head in cold water, especially if accompanied by a drawing-up of the water into the nostrils; or Dr. Negrier's plan of causing the patient, in a standing position, suddenly to raise his arms straight upwards, and to retain them for a short time in this position—a remedy which he states to have always succeeded, even in very bad cases, when other means had failed. Should these means fail, recourse must be had to astringent injections (for example, twenty grains of alum dissolved in an ounce of water) thrown up the nostrils by a syringe, or to astringent powders (as finely-powdered galls, kino, matico, alum, etc.), blown up the nostrils by means of a quill or other tube, or snuffed up by the patient. As a final resource, direct compression must be applied, Abernethy never failed in stopping the bleeding by winding a piece of moistened lint around a probe, so as to form a cylindrical plug, passing this along the floor of the nose for its entire length, then carefully withdrawing the probe, and allowing the lint to remain for three or four days. Cases occasionally occur in which it is necessary also to plug the posterior orifices of the nostrils by an operation, into the details of which it is not necessary to enter.

Polypus, which is an old term employed to signify any sort of pedunculated tumor firmly adhering (literally, "by many feet") to a mucous surface, is of common occurrence in the nostrils; its most usual seat of attachment being one of the turbinated bones. The ordinary kind is of the consistence of jelly, yellowish, streaked with blood-vessels, and of a pear-shaped form. The patient has a constant feeling of fullness in the nostril (as if he had a cold in the head); he cannot effectually blow his nose; and his voice is sometimes rendered more or less thick and indistinct. If he force his breath strongly through the affected nostril, and at the same time compress the other, and close the mouth, the polypus may generally be brought in view. The best treatment is to seize the neck or pedicle with the forceps, and twist it off. The consequent hemorrhage may be readily checked by the means already described.

Foreign bodies are often inserted into the nostrils by children, and become impacted. They may usually be extracted by a small scoop or a bent probe. If they cannot be removed by these means, they must be pushed back into the throat through the posterior nares.

Children are occasionally born with imperforated nostrils. This congenital malformation may, however, usually be remedied by surgical assistance.

NOTABLES, the name formerly given in France to persons of distinction and political importance. As the states general were inconvenient to the despotism of the monarchy, the kings of the House of Valois adopted the expedient of calling in their stead *Assemblies of the Notables*, the time of calling them and the composition of them being entirely dependent on the pleasure of the crown, by which also their whole proceedings were guided, so that they generally consented at once to whatever was proposed to them. They showed a particular readiness in granting subsidies, to which they themselves, as belonging to the privileged classes, were not to contribute. An Assembly of Notables, convened in Paris by Richelieu in 1626, and presided over by Gaston, brother of Louis VIII., consisted of only 35 members. For more than a century and a half even this poor acknowledgment of any other mind or will in the nation than that of the sovereign ceased to be made; but when the state of the finances brought the monarchy into difficulties and perils, Louis XVI., at the instigation of the minister Calonne, had recourse again to an Assembly of Notables, which met Feb. 22, 1787, and was dissolved May 25. It consisted of 137 members, among whom were 7 princes of the blood, 9 dukes and peers, 8 marshals, 11 archbishops, 22 nobles, 8 councilors of state, 4 masters of requests, 37 judges, 12 deputies of the Pays d'Etats, the civil lieutenant, and 25 persons belonging to the magistracy of different cities of the kingdom. Calonne's representations of the state of the finances induced the Notables to adopt many reforms in the matter of taxation; but no sooner was the assembly dissolved, than many of them joined the parliaments in opposition to resolutions adverse to their private interests, so that the king was compelled to determine upon assembling the states general. Neeker, who had meanwhile been placed at the head of affairs, assembled the Notables again, Nov. 6, 1788, to consult them concerning the form in which the states general should be convened. The Notables declared against every innovation, and so compelled the court to half measures which helped to prepare the way for the Revolution. The parliament of the new principality of Bulgaria is spoken of as the Assembly of the Notables.

NOTACANTHIDÆ, a family of acantheropterous, fishes allied to the mackerels: indeed, they were formerly placed in the same family, (*scomberidæ*). They have also been placed by recent writers in a separate order (*opisthomi*). They have an elongated eel-like form, and the caudal extremity is surrounded, as in eels, by a continuous fin. The body is covered with very small cycloid scales, and the lateral line is well marked. They are five species, 1. *notocanthus nasus*, Greenland, 2. *n. Bonapartii*, 3. *n. Mediterraneus*, 4. *n. Sexspinus*, Australia, 5. *n. rissoanus*, Mediterranean.

NOTARY-PUBLIC is an officer of the law, whose chief function is to act as a witness of any solemn or formal act, and to give a certificate of the same; which certificate, if duly authenticated, is accepted all the world over as good evidence of the act done in his presence, and attested by him. The services of a Notary are chiefly available where his evidence is to be used in a foreign country. Solicitors are sometimes notaries-public, but in England there are fewer notaries, comparatively, than in Scotland, where notarial acts and certificates are more largely used.

NOTARY PURLIC (*ante*), an officer introduced from the civil law, and known in ancient Rome as *tabellio forensis;* in England, appointed by the archbishop of Canterbury. In this country, the duties of a notary vary in the different states, being a matter of statutory regulation. But in general his duties are to protect bills of exchange, to take oaths and affirmations, to attest legal instruments, and to certify to documents. Notaries in England have always exercised the right of administering oaths, and that right has been confirmed by the statute, 5 and 6 Will. IV. In this country, the right can be exercised only where express statutory authorization is given, unless the oath administered is to be used in proceedings in the U. S. courts, or courts outside of the state. The act of Congress, Sept. 16, 1850, gave notaries equal authority with justices of the peace to administer oaths and take acknowledgments. A notary is liable for damages resulting from negligence in the discharge of his duties. He cannot as a rule delegate his notarial authority to another person. But a protest of a foreign bill of exchange by a notary's clerk, if such delegation be shown to be a commercial custom in the place fixed for the payment of the bill is valid. Where a notary is employed by an agent, and is guilty of negligence, the question arises whether the principal has a remedy against the agent, or against the notary: thus where an agent entrusted with the collection of a bill of exchange has it protested by a notary, whose negligence discharges the drawer and indorsers. Some courts hold that the principal may recover against the notary only when the latter's act is purely notarial, i.e. one that can be performed only by a notary; other courts hold that the remedy of the principal is against the notary only, whether the act be notarial or not.

NOTATION, the method of representing numbers and quantities by marks or signs. The representation of numbers is known as "arithmetical," and that of quantities as "symbolical" notation.

1. ARITHMETICAL NOTATION.—The invention of arithmetical notation must have been coeval with the earliest use of writing, whether hieroglyphic or otherwise, and must have come into use about the time when it was felt that a mound, pile of stones, or huge misshapen pillar, was insufficient as a record of great events, and required to be supplemented by some means which would suffice to hand down to posterity the requisite

information. The most natural method undoubtedly was to signify "unity" by one stroke, "two" by two strokes, "three" by three strokes, etc.; and, as far as we know, this was the method adopted by most of those nations who invented systems of notation for themselves. It is shown on the earliest Latin and Greek records, and is the basis of the Roman Chinese, and other systems. We have thus a convenient division of the different notational systems into the *natural* and *artificial* groups, the latter including the systems of those nations who adopted distinct and separate symbols for at least each of the nine digits. The Roman and Chinese systems are the most important of the former, and the Hebrew, later Greek, and "decimal" systems of the latter group.

Roman System.—The system adopted by the Romans was most probably borrowed at first from the Greeks, and was distinguished equally by its simplicity and its cumbrousness. The following seems to be the most probable theory of its development. A simple series of strokes was the basis of the system; but the labor of writing and reading large numbers in this way, would soon suggest methods of abbreviation. The first and most natural step was the division of the strokes into parcels of tens, thus,  a plan which produced great facility in the reading of numbers. The next step was to discard these parcels of ten strokes each, retaining only the two cross strokes, thus, ×, as the symbol for 10. Continuing the same method as larger numbers came to be used, they invented a second new symbol for 100, thus, ⊏ (which was at first probably the canceling stroke for ten ×'s in the same way as × was originally the canceling stroke for ten units); and for the sake of facility in writing, subsequently employed the letter C, which resembled it, in its place. The circumstance that C was the initial letter of the word *centum*. "a hundred," was doubtless an additional reason for its substitution in place of the original symbol for 100. An extension of the same process produced M, the symbol for 1000, which was also written ↀ, ⅯⅯ, and very frequently CIↃ. This symbol was probably suggested by the circumstance that M was the initial letter of the Latin word *mille* signifying a thousand. The early Roman system went no higher. But though the invention of these three symbols had greatly facilitated the labor of writing down and reading off numbers, further improvements were urgently required. The plan of "bisection of symbols" was now adopted; × was divided into two parts, and either half, ⅤⅤ or ∧, used as the symbol for 5; ⊏ was similarly divided, ⌐ or ⌊ standing for 50; and ↀ, CI, or IↃ, was obtained in the same manner, and made the representative of 500. The resemblance of these three new symbols to the letters V, L, and D, caused the substitution of the latter as the numerical symbols for 5, 50, and 500. A final improvement was the substitution of IV for 4 (in place of IIII), IX for 9 (in place of VIIII), XC for 90 (instead of LXXXX), and similarly XL for 40, CD for 400, CM for 900, etc; the smaller number, when in front, being always understood as subtractive from the larger one after it. This last improvement is the sole departure from the purely additional mode of expressing numbers; and if the symbols for 4, 9, 90, etc., be considered as single symbols, which they practically are, the deviation may be looked upon as merely one of form. In later times, the Roman notation was extended by a multiplication of the symbol for 1000, thus CCIↃↃ represented 10,000; CCCIↃↃↃ represented 100,000, etc.; and the bisection of these symbols gave them IↃↃ and IↃↃↃ as representative of 5,000 and 50,000 respectively. This, in all probability, is the mode according to which the Roman system of notation was constructed. To found a system of arithmetic upon this notation, would have been well-nigh impossible; and so little inventive were the Romans, that the attempt seems never to have been made. They performed what few calculations they required by the aid of the *abacus* (q.v.).

Chinese System.—This system presents a strong resemblance to the former, but is, in facility of expression, much superior to it. Like the Roman, it retains the primitive symbols for the first three digits, and like it also expresses the last four by prefixing a new symbol to the symbols for the first four, and the analogy is continued up to "twenty." From this point onwards, the Chinese system departs from the "additive" principle, as 20, 30, etc., are represented not as in the Roman system by a repetition of the symbol for 10, but by affixing to the symbol for 10, on its left side, the symbols for 2, 3, etc., as multiples. The same method is adopted with the numbers 200, 300, etc.; and should the number contain units, they are annexed on the right-hand side. For small numbers up to 20, the Roman notation is more expeditious, on account of the greater simplicity of its characters; but for very large numbers, the Chinese is scarcely more cumbrous than our own. Some numbers which are expressed by the Chinese with 14 characters, require more than 100 symbols when expressed in the Roman notation.

Previous to the intercourse of the western European nations with China, their notation was much more cumbrous than it is at present; but the changes since made have affected merely the form of the characters, without altering the principle of the system.

Artificial Systems.—The first of these, in point of date, is the Hebrew; but as the knowledge we possess of it is very meager, and as its principle was adopted by the Greeks in the construction of their improved system, it will be sufficient to describe the latter.

Greek System.—The Greeks at first used a method similar to the Romans, though at the same time they appear to have employed the letters of the alphabet to denote the first 24 numbers. Such a cumbrous system was naturally distasteful to so fastidious a race, and they hit upon the happy expedient of dividing their alphabet into three portions—

using the first to symbolize the 9 digits, the second the 9 tens, and the third the 9 hundreds. But as they possessed only 24 letters, they had to use three additional symbols; their list of symbols of notation then stood as follows:

Units.		Tens.		Hundreds.	
α represents	1	ι represents	10	ρ represents	100
β	2	κ	20	σ	200
γ	3	λ	30	τ	300
δ	4	μ	40	υ	400
ε	5	ν	50	φ	500
ϛ (introduced)	6	ξ	60	χ	600
ζ	7	ο	70	ψ	700
η	8	π	80	ω	800
θ or ϑ	9	ϟ or ϙ (introduced)	90	ϡ, ͱ, ͳ (introduced)	900

By these symbols, only numbers under 1000 could be expresied, but by putting a mark, called *iota*, under any symbol, its value was increased a thousand-fold, thus $\alpha = 1000$, $\alpha = 20{,}000$; or by subscribing the letter M, the value of a symbol was raised ten thousand-fold, thus, $\eta_{M} = 80{,}000$. For these two marks, single and double dots placed over the symbols were afterwards substituted. This improvement enabled them to express with facility all numbers as high as 9,990,000, a range amply sufficient for all ordinary purposes. Further improvements were made upon this system by Apollonius, who also by making 10.000 the root of the system, and thus dividing the symbols into tetrads, greatly simplified the expression of very large numbers. Both Apollonius and Archimedes had to a certain extent discovered and employed the principle of giving to symbols values depending on their position and multiplicative of their real value, but this principle was applied to tetrads or periods of four figures only, and the multitude of symbols seems to have stood in the way of further improvement. Had Apollonius, who was the chief improver of the system, discarded all but the first nine symbols, and applied the same principle to the single symbols which he applied to the "tetrad" groups, he would have anticipated the decimal notation.

The Greek arithmetic, founded upon such a system of notation, was necessarily lengthy and complicated in its operations, each number in the multiplicand forming with each number in the multiplier a separate product (not as in our system, where one product blends with another by the process of "carrying"), though by arranging these products in separate columns, according as they amounted to units, tens, hundreds, etc., the process was somewhat simplified. But when fractions formed part of the multiplier and multiplicand, the Greek arithmetic became almost unmanageable, till the invention of sexagesimals (q.v.) by Ptolemy superseded it. After Ptolemy's death, all improvement was arrested.

Decimal System.—The decimal system, which was introduced into Europe from the east (see NUMERALS), was first employed by the Spaniards, and was from them transmitted to the French and Germans, through whom its use was extended over Europe. The modern arithmetic was not practiced in England until about the middle of the 16th c., and for a long time after its introduction was taught only in the universities. The decimal system, possessing only 9 symbols—viz., 1, 2, 3, 4, 5, 6, 7, 8, 9 (called the nine digits)—adopts the principle of giving to each symbol or "figure" two values, one the absolute value, and the other a value depending upon its position. The numbers from "one" to "nine" inclusive, are expressed by the nine digits; ten is expressed by writing a cipher or zero after 1 (10), thus throwing it into the second place, and giving it a positional value ten times its absolute value. From the principle that a figure thus moved one place to the left is held to be increased in value ten times, this method of notation is called *decimal* notation (Lat. *decem*, ten), and *ten* is said to be the "radix" of the system. The numbers from "eleven" to "nineteen" inclusive are expressed by taking the symbol 10 and putting the digits from "one" to "nine" inclusive in place of the zero—e.g., twelve is written 12, 1 *in position* signifying ten units, and 2 two additional units. On the same principle, twenty is expressed by putting 2 in the second position (20), and so on to 99. To express a hundred, 1 is put in the third place (100), thus making its value ten times what it is in the second place, or ten times ten units; two hundred is similarly expressed by 200, etc.; and should a number of tens and units amounting to less than a hundred exist in the number, the symbols expressing them are substituted for the two zeros. This process can be similarly continued without limit.

There is another way of looking at this notation, which is perhaps simpler and clearer. In such a number, e.g., as 333, instead of attributing different values to the figure 3 in the different positions, we may consider it as symbolizing the same number throughout, namely, *three;* but three *what?* In the first place, it signifies three ones or units (e.g., three single pounds or sovereigns); in the second place, it still signifies three, but now it is three "tens" or decades (three parcels of ten sovereigns each); and in the third place, it still signifies three, but now three hundreds (three parcels of a hundred each). It is from this point of view that the first place to the right is called the *place of units*, or the *units' place;* the second, the *place of tens*, and so on. When such a number as 6473 is analyzed on this principle, it is seen to mean 6×1000 (6 times 1000) $+ 4 \times 100 + 7 \times 10 + 3 \times 1$;

and 6004 becomes $6 \times 1000 + 4 \times 1$. In this latter instance the peculiar importance of the figure 0 is seen (see NOTHING). Following out the method, the general formula for all numbers is $a \times 10^n + b \times 10^{n-1} + c \times 10^{n-2} + \ldots + m \times 10^3 + n \times 10^2 p \times 10 + q$, where a, b, c, ... m, n, p, q, stand for any of the nine digits or zero.

The special advantages of such a system are manifold. It enables us to express small numbers with the greatest ease, and as the smaller numbers are those most commonly used, this is a great point in favor of the system. It also gives to computation a unity which could never under any circumstances have existed in the systems of notation above described, and the most ordinary, and at the same time effective illustration of this is the process of "carrying" in multiplication, whereby one product is blended with another, and much time and trouble in the subsequent addition is saved. This simplification, however, is chiefly due to the introduction of the symbol 0, which, supplying the place of an absent digit, preserves to those figures on the left of it their true positional value. Another advantage of this system is the ease with which computations involving fractions are performed (see FRACTIONS, DECIMAL). The use of the number 10 as *radix*, is universal in all systems of notation; but it has been often doubted, and in some respects with good reasen, whether it is the number best fitted for this position, and many have proposed to substitute 12 for it. This question will be referred to under SCALES OF NOTATION.

2. SYMBOLICAL NOTATION, the general designation of those symbols which are used by mathematicians to express indefinite quantities. The symbols are generally taken from the English, Roman, and Greek alphabets, and are apportioned as follows: Algebraic quantities are expressed by the English alphabet; those which are known, by the earlier letters a, b, c, ..., and those which are unknown, by the later ones, u, v, w, x, y, ... In trigonometry, the letters a, b, c, ... denote measures of length, and A, B, C, ... are used to express angles. In mechanics and astronomy the Greek letters are generally used to express angles. When different sets of quantities are similarly related among themselves, the sets are, for convenience, expressed by the same letters; and to prevent confusion, each set has a peculiar mark attached to each symbol, thus, a, b, c, ... denote one class; and a', b', c', ... another class; a'', b'', c'', ... a third class; and so on; or, a_1, b_1, c_1, ... a_2, b_2, c_2, ..., etc.

NOTE, in music, a character which by the degree it occupies on the staff represents a sound, and by its form the period of time or duration of that sound. The notes commonly in use in modern music are the semibreve, ; minim, ; crotchet, ; quaver, ; semiquaver, ; demisemiquaver, ; and semi-demiquaver, . Taking the semibreve as unity, the minim is $\frac{1}{2}$ its duration, the crotchet $\frac{1}{4}$, the quaver $\frac{1}{8}$, the semiquaver $\frac{1}{16}$, the demisemiquaver $\frac{1}{32}$, and the semi-demiquaver $\frac{1}{64}$. Notes of greater length than the semibreve were formerly in use—viz., the breve, twice the duration of the semibreve; the long, four times; and the large, eight times the semibreve. Of these, the breve, or , is still sometimes met with in ecclesiastical music.—The term note is often used as synonymous with musical sound.

NOTES OF THE CHURCH are marks by which a true church is distinguished. Practically, as to human judgment, they vary according to the different theories held concerning the constitution of a church. Irenæus refers to the unity of the church's doctrines, and her succession of bishops from the apostles; Tertullian appeals to the antiquity of the church derived from the apostles, and its priority to all heretical communities. The creed of Constantinople defines the church as "One, holy, Catholic, and apostolic." Augustine discerned the church chiefly in the consent of nations, authority founded on miracles, sanctity of morals, succession of bishops from Peter, and even in the name "Catholic church." Jerome specifies the duration of the church from the apostles and the Christian name. Luther insists on the uncorrupted preaching of the gospel, administration of baptism, and of the eucharist, and the keys. Calvin regards chiefly truth of doctrine and right administration of the sacraments. Bellarmine multiplies the marks into catholicity, antiquity, duration, amplitude, episcopal succession; apostolical agreement, unity, sanctity, and efficacy of doctrine, holiness of life, miracles, prophecy, admission of adversaries, unhappy end of enemies, and temporal felicity. Bishop Taylor mentions antiquity, duration, succession of bishops, union of members among themselves and with Christ, and sanctity of doctrine.

NOT GUILTY is the form of verdict in a criminal prosecution, and also in some civil actions, when the jury find in favor of the defendant or accused party. The verdict is conclusive, and the accused cannot, in criminal cases, be tried a second time.

NOTHING, in mathematical language, denotes the total absence of quantity or number, as when equals are subtracted from equals, but it is often employed (see LIMIT) to indicate the limit to which a constantly decreasing position quantity approaches. The absence of number or quantity could be equally well signified by the absence of any symbol whatever, but the presence of "0" shows that in its place some number or quantity might, and under other circumstances would, exist.

In physics, the symbol "0" is generally denominated *zero*, and has a different mean-

ing. Like the former, it is the starting-point from which magnitude is reckoned; but while the starting-point in the former case was absolute, in this case it is conventional, and by no means denotes the absence of all quantity or magnitude. Thus the zero-point of the thermometer must not be interpreted to signify that when the mercury has fallen to this point atmospheric heat has totally vanished, but must be understood as a mere conventional starting-point for graduation, chosen for convenience, and not even necessarily representing any fixed natural degree of temperature.

NOTHOPIDÆ, a family of non-venomous snakes, established by prof. Cope, for a peculiar genuine type made known by himself. It is related to the boas and pythons, but is of small size. The only known species is found in central America.

NOTICE, in law, denotes existing knowledge of some fact or the act of giving information. In the former sense it may be actual or constructive, actual when the party is directly informed of the fact by word of mouth or by letter; constructive, when the party is legally presumed to have information on grounds of public policy or has been "put upon inquiry" by his knowledge of facts intimately connected with the particular fact in dispute. Thus a party to a suit has constructive notice of a newspaper advertisement published by order of the court, and a person accepting a conveyance which refers to some other deed is bound to consult the latter or take the consequence of his negligence. But when the liability of a party to do or not to do a certain act is conditional on the occurrence of a fact which is best known to the other party, the plaintiff must prove that actual notice was given to the defendant. Averment of notice is the allegation in a pleading that notice has been properly given, and there must be such averment when the matter lies more properly in the knowledge of the plaintiff than the defendant; in common law pleading omission of averment is fatal on demurrer or a claim of judgment by default. Notice to plead before a fixed time must be given in writing before judgment can be signed for non-pleading, and, in general, notice must always be given to the opposing party of any new step in procedure. Secondary evidence cannot be offered of the contents of a written instrument until notice has been given to the opposing party to produce it on trial, except where the party in possession holds the paper by fraud or when he is supposed from the nature of the case to have constructive notice. The notice to produce should be in writing, should clearly describe what is required, and must be served on the party or his attorney a reasonable time before trial. Notice of dishonor must be given to an indorser of a promissory note and to the drawer or indorser of a bill of exchange, when demand for payment or acceptance has been made and refused by the maker of the note or by the drawer or acceptor of the bill of exchange, in order to change such indorser or drawer. Only persons who after dishonor are at once liable to an action on the negotiable paper need be immediately notified. Notice of dishonor must be immediate, must clearly describe the bill or note and the nature of the non-acceptance, may be oral though usually in writing, and may be served personally or by mail. Notice to quit from a landlord to a tenant is necessary only when the tenant holds at will or for an uncertain time. Notice in this case should be served by the owner or agent upon the tenant in person or some member of his family and at his usual place of abode. A time must be fixed at the end of which the premises must be vacated. This at common law was 6 months, but in this country is governed by statutory enactment, being, in many cases, 3 months. When there are joint tenants or tenants in common the notice must be addressed to all but may be served on one. After the specified time has passed any act of the landlord which recognizes the continuance of the tenant in possession of the premises is a waiver of the notice. The acceptance of rent, if not explained, would constitute such an act. Where A. assigns to C. a debt due from B., B. is not affected by the assignment without due notice. Thus where a mortgage has been assigned and subsequently the mortgageor not having notice, has made payments to the original mortgagee, such payments are good, and the assignee cannot recover from him. In a contract notice may be expressly required or may be implied from the nature of the agreement. If the act to be done is indefinite—as to pay for certain kinds of lumber as much as could be gotten by the vendor from any one else—it is obvious that notice is necessarily implied; not so, however, when the act is definite or specific, as to pay a fixed sum on the occurrence of a certain event. When a *bona fide* purchaser for consideration has had notice of the existence of fraud or unfairness in the contract by which his vendor obtained the possession of the article bought, that contract cannot be sustained on the ground that he is an innocent third party.

NOTICE TO QUIT, is the formal notice given by a landlord to a tenant, or by a tenant to a landlord, that the tenant ought or intends to quit at a future day named. See LANDLORD AND TENANT.

NOTIDANIDÆ, a family of sharks distinguished by the number of branchial apertures, which are six or seven. There are three genera, *hexanchus*, *heptanchus*, and *notorhynchus*, the latter inhabiting south African, and western North American shores, and the first two the Atlantic ocean and Mediterranean. The members of the family are small, none of them much exceeding 3 ft. in length.

NO'TO, a t. of Sicily, in the province of Syracuse, and 16 m., s.w. of the city of that name, 3 m. from the sea. It is of the highest antiquity, was a place of great strength

under the Saracens, and held out against the invading northmen longer than any other town of Sicily. It is a very handsome town, contains rich churches, beautiful palaces, and broad and straight streets. Its academy has a library attached, and a collection of antiquities. A good trade is carried on in corn, wine, oil, and the other produce of the vicinity. Pop. 14,619. Noto was destroyed by an earthquake in 1693, and rebuilt about 4½ m. from its former site.

NOTOCHORD, the *chorda dorsalis* (q.v. in DEVELOPMENT OF THE EMBRYO, *ante*).

NOTOPTERUS, a genus of fish belonging to the herring family (*clupeidæ*).

NOTOTHENIIDÆ, a family of acanthopterous fishes, inhabiting southern seas, and representing the cod-fishes of the northern. The greatest number of species belong to the typical genus *notothenia*, and they are abundant on the southern shores of South America.

NOTOR'NIS, a genus of birds of the family *Rallidæ*, nearly allied to the coots, although in some of its characters it resembles the ostrich family. One living species only is known. *Notornis Mantellii*, a native of New Zealand. It is particularly interesting, because the genus was originally established and the species characterized by Owen, from remains found along with those of *dinornis* and other large birds of the ostrich family, called moas by the New Zealanders. The bird was, however, ascertained in 1850 still to exist. It inhabits some of the most unfrcquented parts of the middle island. It is larger than the other coots, but small in comparison with the true moas. The flesh is said to be delicious. It seems to be a bird likely soon to become extinct unless preserved by human care, and of which the domestication would be easy and desirable.

NOT PROVEN is a form of verdict used in Scotland in criminal prosecutions when the jury think there is some foundation for the charge, but the evidence is not strong enough against the prisoner to warrant a verdict of guilty. In such a case, a verdict of "Not Proven" is substantially a verdict of acquittal. The prisoner cannot be tried afterward, even though new and conclusive evidence come to light after the verdict.

NOTRE DAME, i.e., *Our Lady;* the old French appellation of the virgin Mary, and therefore the name of a number of churches dedicated to the virgin Mary in different parts of France, and particularly of the great cathedral of Paris.

NOTRE DAME, CATHEDRAL OF (*ante*), the most celebrated church among the many of that name in France. It is the cathedral of Paris; and by its great age, the majesty of its proportions, and the stirring scenes of seven centuries of history, of which it has been either theater or witness, it is one of the remarkable historical monuments of the world. History does not reach to the time when its site was not the site of a sanctuary. In the reign of the Roman emperor Tiberius altars for pagan worship existed on the east end of the island in the Seine, where Notre Dame now stands. The remains of a temple of Jupiter and Cernnunos, and the image of a horned god, were found on the spot about 375, when a church was erected on the same site; supposed to have been the first Christian church erected in north France. In the 6th c. there were two churches there, St. Etienne and Ste. Marie. Childebert rebuilt the latter about the year 520 in a Roman style, considered very grand. The first glass window now known of in France was placed in it. Fragments of mosaic and precious marbles supposed to be from the floor and columns of this church were discovered in excavations in 1847, and are now in the *Musée de Cluny*. This church was pillaged and partly destroyed by the Normans in 857, but it was repaired by "Anscheric, 50th bishop of Paris." In 1140 the abbé of St. Denis put in a glass window of great beauty. It was then called the *Eglise neuve*, to distinguish it from the *St. Etienne*, called *le vieux*. In the 12th c. both were falling into ruins, though they had for centuries been used for the great religious ceremonies and royal pageants of France. About 1160 bishop Maurice de Sully resolved to replace both old churches with a single edifice worthy the capital of the kingdom, and in 1163 the foundation of the present majestic pile was begun, and its corner stone placed by the hands of pope Alexander III., then a refugée in France. The work was pushed rapidly, so that, in 1182, on Wednesday of the pentecost, the great altar was consecrated by a legate of the pope. In 1185 Heraclius, patriarch of Jerusalem, came to Paris to officiate with the bishop in the dedication of the choir. Henry II., king of England, was interred before its high altar in Aug., 1186. Notwithstanding the completion for service of the body of the church in the 12th c., the grandest part of the cathedral—its western front with the two towers—was only begun by bishop Pierre de Nemours, A.D., 1208. It rose at the rate of about one story in the life of one generation of men. The portal of the south transept façade was built still later, as shown by an inscription of the mason who began work upon it in 1257, in the reign of St. Louis. Other, and some of the most beautiful, portions were completed during the succeeding centuries. The environing chapels in the rear of the transepts were not a part of the original design, and were added in the last part of the 13th c., about which time, also, the towers of the west front were complete. In 1699 Louis XIII. was seized with the ambition to place in the cathedral an altar piece in the renaissance style, then just coming into vogue; and removed the original altar to give place to it. Other alterations were made by Soufflot, an eminent architect, in 1771–78. During the revolution, the masses of saintly carvings upon the church were threatened with destruction by the infidel mobs, and were saved at one time by a ruse of Chaumette, who assured

the people that information concerning the planetary system was embodied in some of the image sculpture. But the statues of the old kings of France, which were upon the gallery of the grand façade, did not escape the vandalism. In 1793 the cathedral became, by law of the revolutionists, the Temple of Reason. In 1845 the first thoroughly intelligent and comprehensive work for the restoration of Notre Dame was entered upon, under the control of architects Lassus and Viollet-Leduc. Their work was prosecuted uninterruptedly for ten years, so that by 1855 the marvelous blending of majesty of proportion with grace of detail and spirit in design in its west façade were exhibited in bolder relief than ever before in all its history. During the reign of Louis Napoleon the vast structure, on every side, from foundation to pinnacles, was cleaned and repaired; and for the first time in the seven hundred years of its growth could be seen with all its varied constructions as one completed whole. The year 1882 will be the 700th anniversary of its consecration. From 1182 to the present its lofty nave, its altars, and its chapels, have been the scenes of all the most important ceremonies of church and state in France. The baptism of princes, their marriages, coronations, royal funerals, the reception of the great dignitaries of the church, Te Deums for victories, and the surging masses of Parisian revolutions for seven hundred years have made historic procession under its lofty vaults. The architecture embraces nearly every noble feature peculiar to the era that witnessed the growth and culmination of Gothic architecture, and for simple majesty of expression its façade has no superior. The extreme length of the cathedral is 430 ft.; width at transept, 170 ft.; and area covered by it, 64,108 sq.ft.; height of towers, 223 ft.

NOTRE DAME, School Sisters of. See School Sisters.

NOTRE DAME, University of, at Notre Dame, St. Joseph co., Ind., a Roman Catholic institution, founded in 1842. It has no endowment. It has 14 buildings, good laboratories and apparatus, with cabinets and collections of art, and a library of 30,000 volumes. It embraces a preparatory school, a commercial and classical department, and schools of art, science, medicine, and law. The students are trained in gymnastic and military exercises. Jan. 1, 1880, it had 20 professors, 19 other instructors, 350 students, and 400 alumni. President, the very rev. William Corby, c.s.c.

NOTT, Eliphalet, d.d., ll.d., 1773–1866; b. Ashford, Conn. He enjoyed the careful training of an excellent mother, and at the age of four had read the Bible through. At the age of 16 he taught school, and at 18 took charge of the Plainfield academy, pursuing at the same time his classical and mathematical studies with the rev. Dr. Benedict. From Plainfield he went to Brown university, remaining a year, but died not graduate, though in 1795 he received the degree of master of arts. He then studied theology with his brother in Franklin; was licensed by the New London Congregational association in 1796; was missionary and school teacher at Cherry Valley, N. Y., in 1795–97; pastor of the Presbyterian church in Albany in 1798–1804. In 1804 he was elected president of Union college, Schenectady. He found the college in a low condition, "without funds, buildings, or library, and in debt," and its friends greatly disheartened; but he was successful in raising funds, and providing for its pressing needs. His remarkable executive abilities, and his power as a disciplinarian, were soon apparent, and young men came to the college from every state in the union. During his presidency of over 62 years, upwards of 4,000 students graduated. Dr. Nott was one of the most distinguished of American educators, and is spoken of as "one of the historical monuments of this country." In 1811 he was the moderator of the general assembly of the Presbyterian church. He published *Counsels to Young Men on the Formation of Character and the Principles which lead to Success and Happiness in Life; Lectures on Temperance*, presenting a convincing argument for the disuse of intoxicating liquors. He published also several baccalaureate and other sermons and addresses. His most remarkable discourse was on the occasion of the fatal duel between Hamilton and Burr. The sermon made a profound impression upon the public mind, and gave him wide fame as a pulpit orator. Dr. Nott had great mechanical talent, and in the "Digest of Patents" are found 30 in his name granted for the application of heat to steam-engines, the economical use of fuel, etc. Dr. Crook, of the *Methodist*, says of him: "Perhaps no American educator, no American preacher, who has seen the dawning of 1865, has had so unique a history—few, probably, so effective a career. Intellectually, he was a remarkable man—many-sided, and superior on most sides. His mechanical genius is well-known, and one of the most famous iron-manufactories (the 'Novelty Works') originated in one of his inventions, which, by its economical peculiarities, was first known as a 'novelty.' He was a great financier, and enriched himself and Union college by his masterly skill and enterprise." Dr. Nott was not only an able theologian, but probably the most finished pulpit orator in the country. "Strong, serene, dignified, beautiful in language, clear in thought." "His most striking characteristic as a preacher was his perfect grace of manner, toned by a perfect graciousness of religious feeling." His memory was extraordinary, contributing greatly to his eloquence, as he was able to go at once from the writing of his discourse to the pulpit without his manuscript, and deliver it without any effort at recollection. He had indomitable force of character, and his mental power was controlled by Christian principles

NOTT, Josiah Clark, 1804–73; b. S. C.; educated at the college of South Carolina, and in medicine at the medical school in Philadelphia, where he was for a time demonstrator in anatomy. In 1829 he returned to South Carolina, and entered upon the prac-

tice of his profession. In 1835 he went to Europe, where he spent a year in the study of medicine and the natural sciences. On his return he settled in Mobile, where he continued to practice medicine, founding, in 1858, a medical college, which became a department of the university of Alabama. He gave much attention to ethnology; and published, besides many contributions to medical periodicals, *Two Lectures on the Connection between the Biblical and Physical History of Man*, 1849; *The Physical History of the Jewish Race*, 1850; *Types of Mankind*, 1854; and *Indigenous Races of the Earth*, 1857. He wrote the last two works in conjunction with George R. Gliddon. He attempted, in his books on ethnology, to disprove the unity of the human race His theories were regarded, in general, as more original than profound.

NOTT, Samuel, d.d., 1754–1852; b. Conn.; brother of Dr. Eliphalet, the president of Union college; graduated at Yale college in 1780; ordained pastor of the Congregational church in Franklin, Conn., Mar. 13, 1782, where he remained until his death, performing his pastoral duties up to his 94th year, and dying from the effects of a fall. He published several occasional *Sermons*.

NOTT, Samuel, 1788–1869; b. Conn.; son of the rev. Samuel of Franklin, Conn., and nephew of the rev. Dr. Eliphalet, president of Union college. He graduated at Union college, 1808; Andover seminary, 1810; ordained (Congregationalist), 1812, with Newell, Judson, Hall, and Rice; and embarked with Hall, Feb. 24, as a missionary of the American board to India. After some delays from the East India company, they reached Bombay, where they began a mission. His health failing, he returned to his native land in 1815. His return caused great disaffection among the friends of missions in America, as in that day it was thought inconsistent for one who had undertaken to labor for Christ among the heathen to return home on any account. He was engaged in preaching, teaching, and writing for the press until 1850. Among his published works was *Slavery and the Remedy*. He died in Hartford, Conn.

NOTTINGHAM, an inland co. of England, between Lincolnshire on the e., and Yorkshire and Derbyshire on the west. Area, 526,176 acres; pop. '81, 391,984. It is 50 m. in length from n. to s., and 20 m. in average breadth. The meridian of 1° w. falls along the middle of the county, and may be said to divide it into two nearly equal portions, of which the eastern, comprising the vale of the Trent, is level, and the western is occupied by hills of no great elevation. In the s. of the co. are the wolds, consisting of upland moors and pasture-lands, broken up by many fertile hollows. In the w. are the remains of the royal forest of Sherwood, famous as the chief haunt of Robin Hood. The principal rivers are the Trent, and its tributaries, the Erewash, Mann, and Idle. The Nottingham and Grantham canal, in the s., connects the Trent with the Witham, and these two rivers are also connected by the Fosse Dyke canal, which, running n.w. from the city of Lincoln, joins the Trent on the n.e. boundary of the county. By the rivers, canals, and North Midland, Sheffield and Lincoln, and Great Northern railways, there is direct communication in every direction. The climate, especially in the e., is remarkably dry. The soil is various; and, with regard to productiveness, the land is not above mediocrity. The usual crops are raised; there are many hop-plantations, and much land is laid out in market-gardens. Extensive tracts have been planted recently. Four members of parliament are returned for the county.

NOTTINGHAM, a municipal and parliamentary borough of England, capital of the county of the same name, and a county in itself, on the Leen at its junction with the Trent, 130 m. n.n.w. of London. It is built principally on the slope and at the foot of a rocky eminence, and, in an architectural sense, it has, within recent years, been much improved. The market-place is 5½ acres in extent, and is surrounded by lofty buildings. The Trent, which passes about a mile s. of the town, and is here about 200 ft. wide, is crossed by railway bridges, and by an ancient bridge of 19 arches. The exchange, the town and county halls, the house of correction, St. Mary's church, the Roman Catholic chapel, and the new free grammar-school, erected in 1868, are edifices worthy of special mention. The free grammar school, with an income from endowment of about £1000 a year, was founded in 1513. A free library was opened in April, 1868. There are numerous hospitals for the poor and infirm. Of the manufactures, which are various and important, the principal are bobbinnet and lace, and cotton and silk hosiery. Cotton, silk, and flax mills, bleaching-works, and wire, iron, and brass works are in operation. Nottingham sends two members to parliament. Pop. '81, 111,631.

The original castle of Nottingham was built by William the conqueror. Ruined during the civil wars, it was rebuilt after the Restoration, and burnt during the reform bill riots. In 1878 it was restored and transformed into a museum and picture gallery.

NOTTINGHAM, Heneage Finch, d.c.l., first Earl of, 1621–82; b. England; son of the recorder of London, and connected with the family of the earls of Winchelsea. He was educated at Westminster school, and at Oxford, and on quitting the university, began to read law in the inner temple, London. In 1660, upon the restoration of Charles II., he became solicitor-general, and represented the crown in the prosecution of the regicides, of the proceedings against whom he published an account, in 1660. In 1661 he was returned to parliament for the university of Oxford, and made a baronet. He was conspicuous in the impeachment of the earl of Clarendon in 1667, and three years

later was made attorney-general. In 1676 he was made keeper of the great seal, in succession to lord Shaftesbury, and in 1675 he became lord chancellor. In 1680 he sat as lord steward, on the trial of viscount Stafford, against whom he delivered judgment with great eloquence. He was made earl of Nottingham in 1681. He published a number of legal arguments and a volume of *Reports of Cases decreed in the High Court of Chancery.*

NOTTOWAY, a co. in s.e. Virginia, bounded on the s. by the Nottoway river; on the Atlantic, Mississippi, and Richmond and Danville railroads; 300 sq.m.; pop. '80, 11,156—11,110 of American birth, 8,143 colored. The surface is uneven, and portions are heavily wooded. The principal productions are tobacco, of which great quantities are raised, Indian corn, wheat, and oats. Co. seat, Nottoway Court House.

NOTTOWAYS, a tribe of Indians, who lived about the Nottoway river, in Virginia. They belonged to the Huron Iroquois family and spoke a language of that family, of which they formed one of the most southern divisions. They gave themselves the name of Cherohakah. They were at one time a powerful tribe, and survived the famous Powhatans. In 1700 they still numbered 130 warriors, and in 1729 they had increased to 200. They were then living in cabins surrounded by a palisade, on the w. bank of the Nottoway. Attempts were made by governor Spottswood and others to civilize and educate them, but unsuccessfully. In 1781 they had a reservation of 27,000 acres, of which only a very small part was under cultivation; and, according to Jefferson, not a single male of the tribe was then left alive.

NOU'KHA, a town of Asiatic Russia, in Trans-Caucasia, is built on the southern slope of the Caucasus mountains, 80 m. s.w. of Derbend, in lat. 41° 12′ n., long. 47° 13′ e. Pop. (1880) 25,000, consisting of native Tartars belonging to the Mohammedan creed, of Armenians, and a few Russians, chiefly officials. Breeding the silk-worm is the staple branch of industry. The native breed of silk-worms is somewhat coarse, and is now being supplanted by the Italian breed.

NOUN (Lat. *nomen*, a name), in grammar, is the term applied to that class of words that "name" or designate the persons and things spoken about. In a wide sense, such words as *rich, tall*, are nouns, as well as *John, man, tree;* for they are names applicable to all objects possessing these attributes. But as words like John, man, tree, suffice of themselves to mark out or designate an object or a definite class of objects, while words expressive of a single attribute, like *rich, tall*, can be used only in conjunction with such a word as *man* or *tree*, the one class are called adjective nouns, or simply adjectives (q.v.), while the others are called substantive nouns, or simply substantives or nouns. Nouns or names, in this narrower sense, may be divided into classes in a variety of ways, according to the ground we take for our division. One of the distinctions commonly made by grammarians is into proper nouns and common nouns. A proper noun is usually defined to be "the name of any individual person, or place," as *John, London;* while a common noun is applicable to every individual of a class of objects, as *prince, city.* But this definition fails to point out the real difference; for there are several Londons, and there are more Johns than princes; other things also have proper names, besides persons and places, as ships (the *Minotaur*), and bells (Big Ben). Providence again, although applicable to only one being in the universe, is not a proper noun. Wherein, then, lies the difference? In order to answer this question, we must advert to an important distinction made by logicians with regard to the import of names. A word is said to *denote* all the objects to which it is applicable as a name; thus, the word *man* is a name for all the objects known individually, as James, John, Adam, Cæsar, etc., and therefore denotes the whole human race; but while thus denoting or naming them, it also implies something concerning them; in the language of logic, it *connotes* that they possess certain attributes, namely (1) a certain corporeal form, knows as the human form; (2) animal life; (3) rationality. All this, at least, is included in the *meaning* or connotation of the word "man." Now, if we consider any noun of the class called common, we find that while it denotes, or names, or points out a certain object, or class of objects, it also conveys or implies some qualities or facts concerning them; in other words, all such names are *connotative*, or have a meaning. Not so with proper nouns. To say that a man is called John Butler, informs us of no quality he possesses, or of any fact except that such is his name. The name itself conveys no meaning; it is *nonconnotative.* And this is what really constitutes a proper name; it is affixed to an object, not to convey any fact concerning it, but merely to enable you to speak about it. Proper names, indeed, are often given at first on account of the object possessing certain attributes; but once given, they do not continue to connote those attributes. The first John Baker was probably so called because he exercised the trade of baking; but his ceasing to bake would not have made him lose the name; and his descendants were called Baker, regardless of their occupation.

Proper names are thus *meaningless marks*, to distinguish one individual from another; and the A, B, C, etc., which a geometrician affixes to the several angles of a figure, are as much proper names as Tom, Lawrie, etc., applied to the individual bells of a chime. The proper contrast then, to a proper noun is not a common noun—meaning by that a name common to a class of objects—but a significant noun.

Of significant nouns, by far the greater number are general or class names; that is, they can be applied to any individual of a class of objects, implying that all these indivi-

duals have certain attributes in common—as *quadruped, book.* The quadruped spoken of may perhaps be a *horse,* and here we have another class-name, applicable to the same object, but of less generality than "quadruped." *Animal,* again, is more general than quadruped; being applicable to a far wider class. But it is important to observe, that as the number of objects that the terms are applied to, or denote, increases, the number of attributes they imply—in other words, the amount of their meaning—diminishes. To call an object an "animal," merely implies that it is organized and is alive (with that kind of life called animal life); to call it a "quadruped," implies all this and a number of attributes in addition; and to call it a "horse" implies a still further addition.

It is to this class of words that the term common nouns is properly applicable; and the contrast to them is not proper nouns, but what might be called singular nouns, such as "God," "Providence," universe."

Collective names are such as *regiment, fleet, senate, shoal.* They form a subdivision of class names or common nouns; for *regiment* is applicable to all collections of men organized in a particular way.

Names of materials are such as *iron, water, sugar, wheat.* These two classes appear in many cases to merge into each other. In both the objects named consist of an aggregation; but in collective names the parts forming the collection are thought of as individual objects; as the *soldiers* of a regiment, the *fishes* composing a shoal. Substances, again, like iron, gold, water, are not made up of *definite* individual parts (at least to our senses); and in such as wheat, sand, the name of the individual visible part (*grain of wheat, grain of sand*) is derived from the name of the mass, showing that the idea of the individual is swallowed up in that of the mass.

A convenient term for names of materials or substances is that used by German grammarians—stuff-nouns. Sometimes the same word is used as a stuff-noun, and also as a class-noun. Thus: "The cow eats *grass*" (stuff-noun); "the botanist studies the *grasses* and has found a new *grass*" (class-noun); "they had *fish* (stuff-noun) for dinner, and consumed four large *fishes*" (class-noun).

Names of materials are not, like collective nouns, a subdivision of common nouns; they belong to the coutrasted class of singular nouns; and, when the substance is simple or invariable in composition, cannot be used in the plural; as *gold, water, beef.*

Abstract Nouns.—In the expression "hard steel," or "the steel is hard," the word *hard* implies a certain quality or attribute as belonging to the steel. This quality has no existence apart from steel or some other substance; but I can withdraw (*abstract*) my thoughts from the steel in other respects, and think of this quality as if it had an independent existence. The name of this imaginary existence or abstraction is *hardness.* All words expressive of the qualities, actions, or states of objects, have abstract nouns corresponding to them; as *brave—bravery; strike—stroke; well—health.* In opposition to abstract nouns, all others are *concrete* nouns—that is, the attributes implied in them are considered as embodied in (*concrete,* Lat. growing together) the actual existences named.

NOUREDDIN-MAHMOUD, Malek-al-Adel, one of the most illustrious men of his time, and the scourge of the Christians who had settled in Syria and Palestine, was born at Damascus, Feb. 21, 1116. His father, Omad-ed-din Zengui, originally governor of Mosul and Diarbekir on behalf of the Seljuk sultans, had established his independence, and extended his authority over Northern Syria, including Hems, Edessa, Hamah, and Aleppo. Noureddin-Mahmoud succeeded him in 1145, and the better to carry out his ambitious designs, changed the seat of government from Mosul to Aleppo. Count Joscelin of Edessa, thinking the accession of a young and inexperienced sovereign afforded him a favorable opportunity of regaining his territories, made an inroad at the head of a large force, but was signally discomfited under the walls of Edessa, his army, with the exception of 10,000 men, being completely annihilated. The report of Noureddin-Mahmoud's success being conveyed to western Europe, gave rise to the second crusade. The crusaders were, however, foiled by Noureddin-Mahmoud before Damascus, and being defeated in a number of partial conflicts, abandoned their enterprise in despair. Noureddin-Mahmoud next conquered Tripolis and Antioch, the prince of the latter territory being defeated and slain in a bloody conflict near Rugia (June 29, 1149), and before 1151 all the Christian strongholds in Syria were in his possession. He next cast his eyes on Egypt, which was in a state of almost complete anarchy under the feeble sway of the now effeminate Fatimites, and, as a preliminary step, he took possession of Damascus (which till this time had been ruled by an independent Seljuk prince) in 1156; but a terrible earthquake which at this time devastated Syria, leveling large portions of Antioch, Tripolis, Hamah, Hems, and other towns, put a stop to his scheme for the present, and compelled him to devote all his energies to the removal of the traces of this destructive visitation. An illness which prostrated him in 1159, enabled the Christians to recover some of their lost territories, and Noureddin-Mahmoud, in attempting their re-subjugation was totally defeated near the lake of Gennesaret by Baldwin III., king of Jerusalem; but undismayed by this reverse, he resumed the offensive, defeated the Christian princes of Tripolis and Antioch, making prisoners of both, and again invaded Palestine. Meanwhile, he had obtained the sanction of the caliph of Bagdad to his projects concerning Egypt, and the true believers flocking to his standard from all quarters, a large army was soon raised, which, under his lieut. Shirkoh, speedily overran Egypt. Shirkoh

dying soon after, was succeeded by his nephew, the celebrated Salah-ed-din (q.v.), who completed the conquest of the country. Noureddin-Mahmoud, becoming jealous of his able young lieut., was preparing to march into Egypt in person, when he died at Damascus, May 15, 1174. Noureddin-Mahmoud is one of the great heroes of Moslem history. Brought up among warriors who were sworn to shed their blood for the cause of the prophet, he retained in his exalted station all the austere simplicity of the first caliphs. He was not, like the majority of his co-religionists, a mere conqueror, but zealously promoted the cultivation of the sciences, arts, and literature, and established a strict administration of justice throughout his extensive dominions. He was revered by his subjects, both Moslem and Christian, for his moderation and clemency, and even his most bitter enemies among the Christian princes extolled his chivalrous heroism and good faith. He possessed in an eminent degree the faculty of impressing his own fiery zeal for the supremacy of Islam upon his subjects, and their descendants at the present day have faithfully preserved both his name and principles.

NOVAC'ULITE, a silicious slate derived from the argillaceous schists of the paleozoic period. Novaculite is the compact and homogeneous portions of the rock. See HONES, *ante*.

NOVALIS. See HARDENBERG.

NOVARA, a province in n.w. Italy, adjoining Switzerland; bounded on the e. by the lake Maggiore and the Ticino, on the s. by the Po, and on the w. by Turin; drained by the Toce and its affluents; 2,526 sq.m.; pop. '72, 624,985. The surface is mountainous, intersected by the Alps, among whose ridges are fertile valleys. The principal productions are silk, hemp, grain, and rice. Capital, Novara.

NOVARA, a t. of Northern Italy, and capital of the province of the same name, is situated in a fertile district about 60 m. n.e. of Turin. Pop. '80, 33,077. It commands fine Alpine views from its ancient dismantled fortifications, and contains several notable churches, especially the cathedral, with its fine frescos and sculptures, and grand high-altar. On March 23, 1849, Novara was the scene of a grand battle between the Sardinian forces and an Austrian army commanded by Radetzky, which resulted in the complete defeat of the Italians, and ultimately led to the abdication of Charles Albert in favor of his son, Victor Emmanuel.

NOVA SCOTIA, a province of the Dominion of Canada, is bounded on the n.w. by New Brunswick and the bay of Fundy, on the n. by the straits of Northumberland and the gulf of St. Lawrence, and on the other sides by the Atlantic ocean. It consists of two portions, Nova Scotia proper, a large peninsula connected with New Brunswick by an isthmus about 15 m. in width, and the island of Cape Breton (q.v.). The peninsula, about 280 m. in length, and from 50 to 100 m. broad, extends in an e.n.e. and w.s.w. direction. Cape Breton lies n.e. of Nova Scotia proper, separated from it by a narrow strait called the gut of Canso, 16 m. long, and from half a m. to 2 m. wide. Sable island, which is 25 m. in length by 1¼ in breadth, and is surrounded by a dangerous, widely-extended sand-bank, is situated about 90 m. from the nearest coast of Nova Scotia, in lat. 44° n. and long. 60° west. It is formed of sand-hills thrown up by the sea, some of them being about 80 ft. in height. The island is covered with wild grasses, which support herds of wild horses, known as Sable island ponies. It is in the track of vessels trading between America and Britain, and owing to the number of wrecks that take place on its shores, a superintendent and several men are stationed here for the purpose of rescuing and aiding shipwrecked mariners. The area of the province is 18,600 sq.m.; pop. '80, 440,572. The coast-line is about 1000 m. in length, and the shores, which are much indented, abound in excellent bays and harbors, of which the chief are Chedabucto bay, Halifax harbor, St. Margaret's, Mahone, and St. Mary's bays, Annapolis, Minas, and Chignecto basins, and Pictou harbor. There are numerous rivers, but few of them are over 50 m. in length; the most important are the Avon, the Annapolis, and the Shubenacadie. Nova Scotia contains about 400 lakes, of which the Bras d'Or, in Cape Breton, covers an area of 500 sq.m., or about one-sixth of the entire area of the island. The surface is irregular and undulating, but not elevated. Ranges of hills traverse the center of Nova Scotia in the direction of its length. The Cobequid mountains, 60 m. from the Atlantic and 1100 ft. high, traverse the peninsula from the bay of Fundy to the straits of Canso. The soil in the valleys is rich and fertile, producing all the fruits of temperate climates; and, especially in the n., the uplands also are fertile. The climate is remarkably healthy, its rigor being modified by the insular character of the province, and by the influence of the gulf stream. The mean temperature for the year is 42.09° at Pictou, and 43.6° at Windsor. The extreme limits of the thermometer may be stated at 15° Fah. in winter, and 95° in the shade in summer. The province abounds in mineral riches, including gold, coal, and iron. Gold was first discovered in the colony in March, 1861, on Tangier river, about 40 m. e. of Halifax. The chief diggings are along the Atlantic coast, and gold has been found in nearly 100 different localities. An act of the legislature regulating the disposal of claims and the collection of revenue from the gold-fields was passed in March, 1862. The gold mines have been worked steadily, and in many cases profitably. In 1871 the yield of gold was 19,227 oz., in value about $355,700; in 1875 the yield was 11,208 oz., valued at $201,756.

In 1875, 781,165 tons of coal and 4,467 tons of iron ore were raised in the province. Of the entire area of the colony, 10,000,000 acres are considered good land, and of these 1,028,032 acres were under cultivation. Three-fourths of the whole area are comprised in the peninsula of Nova Scotia, and the remainder in the island of Cape Breton. The principal agricultural products are: hay, wheat, barley, buckwheat, oats, rye, Indian corn, potatoes, and turnips. The waters around the colony abound in fish, as mackerel, shad, herring, salmon, etc., and the fisheries are pursued with ardor and ever-increasing success. One half of the exported produce, 1882, was from the fisheries; total value nearly £887,472; of which the U. S. received £270,754. The value of dry salted cod-fish, alone, was about £532,223. In 1881 the imports amounted to £8,000,000, the exports to £8,250,000. The number of vessels that arrived in Nova Scotia during the year ending June 30, 1874, was 4,424, of 959,114 tons, and the number that departed 3,752, of 881,263 tons. There are in the colony 1150 m. of telegraph, and 300 m. of railway. It is provided with 5 colleges, 10 academies, 1700 other schools; 50 newspapers, etc.

Nova Scotia is supposed to have been visited and "discovered" by the Cabots in 1497. Its first colonists were a number of Frenchmen, who established themselves here in 1604, but were afterwards expelled by settlers from Virginia, who claimed the country by right of discovery. Under the French settlers it bore the name of Acadia (*Acadie*); but its name was changed for its present one in 1621, when a grant of the peninsula was obtained from James I. by sir William Alexander, whose intention was to colonize the whole country. Having found, however, that the localities they had fixed upon as suitable for settlement were already occupied, the colonists returned to the mother-country. In 1654 the French, who had regained a footing in the colony, were subdued by a force sent out by Cromwell. By the treaty of Breda, the country was ceded to the French in 1667, but it was restored to the English in 1713. After the middle of the 18th c., strenuous efforts were made to advance the interests of the colony. Settlers were sent out at the expense of the British government. The French, who had joined the Indians in hostilities against the English, were either expelled or completely mastered, and Cape Breton, which was French till 1763, and was subsequently a separate province, was united to Nova Scotia in 1819. Nova Scotia was incorporated with the Dominion of Canada in 1867, and is represented in the Canadian parliament by 12 senators, and 20 members of the lower house. It has also its own local legislature and lieutenant-governor; the legislature consisting of a council and a house of assembly elected by the counties—which are 18 in number—and the cities, the chief of which are Halifax, Yarmouth, Truro, and Pictou.

NOVATIAN, a priest of the Roman church in the 3d c., and the leader of a sect called after his name. The place and time of his birth are not known with certainty. Novatian had been a stoic philosopher, but after his arrival in Rome was converted to Christianity, and being seized with sudden illness while still a catechumen, received what was called *clinical* baptism, that is, baptism administered on a sick-bed, and without the solemn ceremonial. Such baptism was, in ordinary circumstances, an impediment to holy orders. Notwithstanding this irregular baptism, Novatian was promoted to orders by Fabian the Roman bishop; and soon afterwards showed his weakness by flying during a persecution. At this time a controversy arose about the manner of dealing with the lapsed: that is, those who fell away in persecution. Novatian at first inclined to the milder side, but on the election of Cornelius to the Roman bishopric to which Novatian had aspired, and on Cornelius taking the indulgent course toward the lapsed, Novatian, together with Novatus and some other discontented priests of Carthage, opposed his authority, and eventually Novatian was chosen by a small party, and actually ordained bishop, in opposition to Cornelius. The party who espoused his cause was called by his name. They were confined mainly, in the first instance to Rome and to Carthage, where a kindred conflict had arisen. They held that in the grievous crime of idolatry through fear of persecution, the church had no power to absolve the penitent: and therefore, although it does not appear that they excluded such sinners from all hope of heaven, yet they denied the lawfulness of re-admitting them to the communion of the church. This doctrine they extended at a later period to all grievous sins, of whatever character. Novatian may thus be regarded as the first antipope. The churches throughout Italy, Africa, and the East adhered to Cornelius; but the Novatian party set up bishops and established churches not only at Carthage, but at Constantinople, Alexandria, Nicomedia, Phrygia, Gaul, Spain, and elsewhere. They claimed for themselves a character of especial purity, and assumed the appellation of Cathari (Puritans). The time and manner of the death of Novatian is uncertain. According to Socrates (*Hist. Eec.* iv. 28; v. 21; vii. 5, 12, 25), he died a martyr in the persecution of Valerian, but this is improbable. He was a man of considerable learning, and the work recently discovered in one of the monasteries of mount Athos, and published by Mr. Miller at Oxford in 1851, under the title of *Origenis Philosophumena*, is by some ascribed to him. His sect survived long after his death. An unsuccessful effort was made in the council of Nice to re-unite them to the church; and traces of them are still discoverable in the end of the 6th century.

NOVATION, in law, the extinguishment of an old obligation by the substitution of a new. The civil law distinguished 3 kinds of novation: 1. Where a new debt is substituted,

due by the same debtor to the same creditor, but with changed terms of payment. 2. Where a substituted new debtor assumes the old debt. This kind of novation is called *delegatio*, and differs from the other kinds in that it may be completed without the knowledge of the original debtor. It can be created by an assignment, by the debtor, of the debt to another person who agrees to become responsible for the debt, and whom the creditor agrees to accept in place of the original debtor. When the novation takes place without the action of the original debtor, the transaction is called *ex promissio*, and the accepted new debtor *ex-promissor*. 3. Where the old debt is made payable to a new creditor. This is also called *delegatio*, and requires the consent of all parties. A novation was not a matter of legal presumption, but an intent to innovate, *animus novandi*, must be distinctly shown. In the absence of proof of such intent to extinguish the old debt, the debtor is liable for that, and also liable under the new obligation. There must have been a precedent obligation, the place of which can be taken by the new. The new obligation is subject to the same conditions, if any, as the old one, and if the old be void, as against good morals, the new one will be void also; but otherwise, at least in some cases, where the old debt was merely voidable—the new promise being considered as a waiver of any disability which might have been a good defense. A consent by parties capable of consenting, is requisite to the validity of a novation, though the older civil law recognized a sort of involuntary novation. All obligations are subject to novation, so that debts by specialty, warranties, legacies, etc., are as capable of novation as debts by simple contract. But it has been held in New York, that an agreement by the obligee in a bond, not to sue the obligor within a certain time, is not a novation, but a covenant, for breach of which the usual action lies. A new debtor has no rights under the old obligation, nor have the creditors any remedy against the old debtor, though the latter be solvent, and the new debtor insolvent. A novation may be conditional, in which case the old obligation subsists, till the condition takes place. All liens attached to the original debt are extinguished by its extinction, unless expressly retained by the new contract; and in an action upon the new contract, no claims or set-offs between the parties to the old contracts can be set up in defense by the new parties. A single creditor may make a contract of novation with two or more debtors, all individually liable. The term novation, in the common law, is much less used than assignment and merger. With some differences, common law and civil law novation are in the main alike. There must have been an original and now extinguished debt, whose cancellation forms the consideration for the new contract, which alone can be the subject of the action. A simple agreement to change the contract is not sufficient; the change must be ratified by the parties, and actually carried into effect. As in the modern civil law, the consent of the debtor is necessary to the novation, and the substitution of a new creditor, nor can the latter, in the absence of such consent and privity, recover against the debtor. There is no privity of contract between them, and to recover, the creditor must show such privity by setting forth a new promise upon sufficient consideration. In equity, however, a debt may be assigned without the debtor's consent, and the assignee can maintain a suit in his own name. But at law, in the absence of consent or consideration, the assignee cannot sue for the debt in his own name, and in a suit upon it, all set-offs, accounts, or equitable defenses, which could be pleaded by the debtor against the original creditor, may be used. The extinction of the original debt is in itself a sufficient consideration, and no consideration need be stated in the new contract, though one must be proved to constitute a valid defense to a suit by creditors of the assignor. The most usual case of novation in modern law, is the substitution of a new bill of exchange, or promissory note for an old one surrendered and extinguished. Wherever an intention is shown to make the new note or bill an absolute payment, it will be so held. In Maine, Vermont, Massachusetts, and some other states, the receipt of a negotiable promissory note or bill is *prima facie* evidence of payment of the debt, and it is held in Louisiana, that the receipt by the creditor for a draft in payment of the account constitutes a novation. The general rule, however, in England and in this country is that the receipt of a promissory note does not make a novation, but is merely *prima facie* evidence of a conditional payment, made absolute payment by the occurrence of the condition, i.e., the payment of the note.

NOVA ZEMBLA (Russ. *Novaja Zemlja*, "new land"), the name given to a chain of islands lying in the Arctic ocean (lat. between 70° 30′ and 76° 30′ n., and long. between 52° and 66° e.), and included within the government of Archangel. Length of the chain, 470 m.; average breadth, 56 miles. The most southern island is specially called Nova Zembla; of the others the principal are Matthew's land and Lütke's land. They were discovered in 1553, and are wild, rocky, and desolate—the vegetation being chiefly moss, lichens, and a few shrubs. The highest point in the chain is 3,475 ft. above the level of the sea. Mean temperature in summer at the southern extremity, 35.51°; in winter, 3.21°. Nova Zembla has no permanent inhabitants, but as the coasts swarm with whales and walruses, and the interior with bears, reindeers, and foxes, they are periodically frequented by fishermen and hunters.

NOVELDA, a t. of Spain, in the province of Alicante, and 18 m. w. from Alicante, on the railway between Madrid and Alicante. There are corn and oil mills, brandy distilleries, and manufactures of lace. Pop. 8,095.

NOVELLÆ. See JUSTINIAN.

NOVELLO, CLARA, a distinguished vocalist, daughter of the following, was b. in 1818. Her talent showed itself very early. At the age of 10 she became a pupil of the French academy of singing for church-music, and studied in Paris for several years, following up her studies in after years in Italy and Germany. Both in England and in Italy she created quite a *furore* from the year 1840 to 1848: her singing has indeed hardly ever been equaled in equality, flexibility, and executive skill. In 1848 she married count Gigliucci, and quitted the stage, returning to it, however, for a time from 1850 to 1860.

NOVELLO, VINCENT, an eminent musical performer and composer, was b. in London, of an Italian father and English mother, in 1781. At the age of 16 he was organist in the chapel of the Portuguese embassy; and even then had attained a large measure of that proficiency on the organ for which he was celebrated in later life. He was one of the founders of the Philharmonic society. His musical compositions, which are very numerous, and chiefly sacred, are considered to have contributed much to the improvement of cathedral music. As a pains-taking editor of unpublished works of eminent musicians, he has also done great service to musical literature. He died at Nice in 1861.

***NOVELS.** The novel and the so-called romance, inasmuch as they constantly merge in one another, and are only superficially distinguished by the preponderance in the one of ordinary and familiar incidents, in the other of incident more or less remote and marvelous, may conveniently be included here under the common definition of prose narrative fiction. Between the legendary epic, the drama into which portions of its available material from fluent become crystallized, and the wider prose fiction or novel, into which this again expands itself, there are obvious affinities, the distinctions being rather of form than of essence. It is of the later development, the novel, that we purpose to give here a historical sketch, omitting, however, any consideration of the remoter and but slightly known specimens produced in Hindustan and China.

1. *Ancient Classical Prose Fiction.*—The earliest Greek compositions of a fictitious character, of which we possess any knowledge, are the *Milesiaca*, or *Milesian Tales*, said to have been written chiefly by one Aristides. The Milesians were a colony of Ionic Greeks who settled in Asia Minor, and fell under the dominion of the Persians, 494 B.C. They were a voluptuous, brilliant, and inventive race, and are supposed to have caught from their eastern masters, whom they somewhat resembled, a liking for that particularly oriental species of literature—the imaginary story or narrative. None of the Milesian tales are extant, either in the original Greek or in the Latin version made by Sisenna, the Roman historian, about the time of Marius and Sulla; but we have some forty stories by Parthenius Nicæas, which are considered to be to a certain extent adaptations from them. The collection of Parthenius is entitled *Peri Erotikōn Pathēmatōn*, and is dedicated to Cornelius Gallus, the Latin poet, and the contemporary and friend of Virgil. If we may judge from this later set of fictions, which are mainly concerned with the description of all sorts of seduction, of criminal and incestuous passions, and of deplorable terminations to wretched lives, we have little cause, either morally or æsthetically, to regret the loss of their more famous prototypes. In Greece proper nothing was done, so far as we know, in the way of novel or romance until after the age of Alexander the great. It has been conjectured, not improbably, that his eastern conquests had a potent effect in giving this new bent to the fancy of his countrymen. Clearchus, a disciple of Aristotle, wrote a history of fictitious love-adventures, and is thus, perhaps, to be considered the first European Greek novelist, and the first of the long series of *erotikoi*, who reach down to the 13th c. after Christ. Not long after came Antonius Diogenes, whose romance, in 24 books, entitled *Ta hyper Thoulen Apista* (of the incredible things beyond Thule), was founded on the wanderings, adventures, and loves of Dinias and Dercyllis. It appears to have been held in high esteem, and was at least useful as a store-house, whence later writers, such as Achilles Tatius, derived materials for their more artistic fictions. The work has not been preserved, but Photius gives an outline of its contents in his *Bibliotheca Cod.*

A long interval, embracing, indeed, several centuries, now elapses before we come upon another Greek novelist or romancist. Be the cause of this what it may, the ever-increasing luxury and depravity of the pagan imperial world, combined to develop and intensify that morbid craving for horrible, magical, and supernatural incidents which in general fill the pages of the romancists of the empire. The first names that occur in the new series are Lucius of Patra (*Patrensis*) and Lucian (q.v.), who flourished in the 2d c. A.D., during the reign of Marcus Antoninus; but as the former simply collected accounts of magical transformations (*metamorphoses*), he is perhaps not to be regarded as a novelist proper at all; while the latter was really a humorist, satirist, and moralist in the guise of a story-teller—in a word, a classic Rabelais and Heine, and as far as possible from being a member of the wonder-loving school of erotics, with whom he has only an accidental connection by the external form of some of his writings. The first of the new series of romance writers, strictly so called, is properly Iamblichus (*not* the Neoplatonic philosopher), whose *Babylonica* is, indeed, no longer extant; but we are able to form a pretty just estimate of it from the epitome of Photius. The next notable name is that of Heliodorus (q.v.), bishop of Trikka, who flourished in the 4th c. A.D. This Christian writer, whose *Loves of Theagenes and Charicleia* is really the oldest extant *erotic* romance, has

far exeelled all his predeeessors in everything that ean render a story interesting or excellent, and his charming fiction obtained a great popularity among such as could read. Some imagine that they see in Heliodorus a resemblance to the minutely descriptive style of novel introduced into England by Richardson, but without adopting this rather extreme notion, it can at least be safely asserted that Achilles Tatius and all the subsequent *erotikoi* deliberately imitated his style and manner, while he was not less certainly used as a model by that once celebrated but dreadfully tedious school of heroic romance which flourished in France during the 17th c., and whose best-remembered representative is mademoiselle de Scudéri. Tasso, Guarini, D'Urfé, and several other modern writers have drawn many particulars—sometimes almost *verbatim*—from the stories in the *Theagenes and Charicleia*. Achilles Tatius (q.v.), probably belonging to the 5th c., ranks next to but at some distance from Heliodorus in point of merit. His romance, entitled *Ta kata Leukippen kai Kleitophonta*, and consisting of eight books, has supplied incidents to more than one Italian and French writer.

The next work that invites our attention in point of time, the *Daphnis and Chloe* of Longus, is of a totally different character. It is a simple and picturesque prose-pastoral, with no poisonings, murders, magic, supernaturalism, and impossible exploits. Over the whole story rest a rural peace and a smile of cheerful sunshine; and, in spite of some singularly polluted passages, it was, for its time, a pure and wholesome fiction. *Daphnis and Chloe* is the only pastoral romance produced by any Byzantine author. Whether or not it exercised any influence on the development of the *modern* pastoral of Italy and France cannot be proved, but it has been noticed that there is no slight resemblance between it and the story of the *Gentle Shepherd*, which we know was suggested to Allan Ramsay by a classical friend, who may have borrowed from the Greek the sketch which he gave to the poet. It has also been very closely imitated by Gessner in his idyl of *Daphnis*.

After Longus comes Chariton (flor. some time between the 6th and 9th centuries), whose romance, in eight books, on the *Loves of Chæreas and Callirrhoë*, is not quite complete, but nearly so. It contains, like the other erotic fictions, plenty of stirring and startling adventures, but on the whole these are less improbable than what we encounter in the writings of his predecessors. Of three Xenophons, also noted among the *erotikoi*, and of uncertain date, the best is Xenophon of Ephesus, whose romance, entitled *Ephesiaca, or the Loves of Anthia and Abrocomas*, is in ten books, and has all the sensational characteristics of the school to which it belongs. It is, however, perhaps worth mentioning that in the romance of Xenophon we meet for the first time with the story of the love-potion, the pretended death, and the mock-entombment of the heroine, which forms the leading incident in Shakespeare's *Romeo and Juliet*, and which, it is thought, reached the great English dramatist at second or third hand, through the Italian novelist Luigi da Porta.

Again a long interval elapses before we meet with another love-fiction of the old pagan sort. During this period, however, a work made its appearance which was essentially a romance, and was composed expressly for the purpose of recommending that form of Christian life which was *the* favorite in early times—the ascetic and recluse form. This was the *Barlaam and Josaphat* (q.v.), the author of which is unknown, but whose popularity, during the middle ages, may be estimated from the fact that it was translated into every language of Christendom from Norway to Spain. In the 12th c. another erotic, Eustathius or Eumathius, who was properly the last of the series, published his *Ismene and Ismenias*, in eleven books. This romance is, in truth, a feeble performance; the expiring flicker of a lamp whose oil is about done. It is puerile in its delineation of character, and full of plagiarisms; yet many of its details have been copied by later occidental writers, such as D'Urfé and Montemayor.

In all the erotic romances the adventures, which in fact eonstitute the story, have eertain common characteristics. The hero and heroine are generally carried off by robbers or pirates; or they flee from home, and are accidentally separated. They resolve to seek each other throughout the world, and in the course of their loving quest they visit the remotest regions, encounter the most frightful perils, make hairbreadth escapes from tragic ends, meet again in most unexpected and miraculous ways, and generally close their career in happiness and splendid prosperity—often turning out to be the offspring of far greater people than they fancied. Copious use is made of poisons, love-potions, improbable tricks, magic instruments, etc.; and one can easily see that the stories were meant to tickle and stimulate a languid, corrupt, sensual, and credulous people, such as the Greeks of the lower empire undoubtedly were.

Before touching on the mediæval romance of western Europe we may in a few words notice such specimens of classical fiction as exist, or are known to have existed in Latin. We have already stated that the Milesian tales were translated into that tongue by Sisenna, who derived his knowledge of them from the Sybarites, a Greek colony of lower Italy. The taste for similar stories increased during the empire, but the writers in general cannot have displayed much genius in their compositions if we may judge from the contemptuous language used by the emperor Severus against Clodius Albinus, whose fictions he designates *ludicra literaria*, and *anilia* (old wives' tales). But higher praise must be assigned to the work commonly attributed to Petronius Arbiter (q.v.), who flourished in the time of Nero, and whose *Satyricon*—incomplete—is a comic novel or romance, and

(although the dirtiest work even in pagan literature) is executed with skill, vigor, and at times, with beauty. In the 2d c. A.D., Appuleius (q.v.), wrote his *Ass* (called from its excellence the *Golden Ass*), which relates the adventures of a young man who had the misfortune to be accidentally metamorphosed into that animal while sojourning in Thessaly: retaining, however, his human consciousness. The miseries which he suffers at the hands of robbers, eunuchs, magistrates, and other persons into whose hands he falls, until the period when he is enabled to resume his former figure, are portrayed with a wit, humor, and fancy, hardly inferior to Lucian. The work is also believed to have had, like the writings of his Greek contemporary, a moral and satirical aim. It was immensely popular in the middle ages; has supplied Boccaccio with some of his stories, and the author of *Gil Blas* with the picturesque incidents of the robbers' cave in the early part of *his* romance, and contains in the episode of *Cupid and Psyche* one of the loveliest allegories of classical antiquity.

2. *Romantic fiction in western Europe.*—The first thing to be clearly understood in connection with this branch of literature is, that it is *not* a continuation of the Græco-Byzantine or classical fiction, though, curiously enough, it began to spring up in the west just as the other was dying out in the east. It is a completely new growth, the product of new historical circumstances, which were but very slightly affected by Byzantine influences of any kind; and it transports us into a world of ideas, sentiments, beliefs, and actions, as different from what we find in the *Erotikoi* as could well be imagined. In the latter, the principal characters are mere lovers *forced* into adventures by the ministers of fate; in the former, they are real heroes, of the old Homeric type, and *seek* dangers greedily and joyously. When we read the *Erotikoi* we are reminded in many ways that we are in the midst of a corrupt and decaying civilization; when we turn to the romances of chivalry in spite of certain superficial and barbarous vices—such as the prevalence of bastardy, and the indifference displayed to bloodshed—we feel that we are in the presence of a youthful, healthy, vigorous, and growing social life. That these romances, generally from beginning to end, consist of a series of extraordinary and utterly impossible exploits, in which the magic, the mystery, and the enchantments of the *Arabian Nights* are rivaled or outshone, is unquestionable; but this proves no more than that the races of western Europe, who slowly, during the dark ages, rose, by the help of the church, out of barbarism into feudalism—the first step toward the civilization of the modern world—were boundlessly ignorant, credulous, and wonder-loving. Their prodigious vigor and vehemence of character, having no proper intellectual *pabulum*, was forced to supply its craving for a knowledge which was beyond its immediate attainment, by the exaggerations of a fancy that was without law or limit. We need not go so far as to assert that, in the mediæval romance, everything is of native or "Gothic" origin; the fact is very much the reverse. This extreme theory, propounded by Mallet, and supported by bishop Percy, and other writers, is totally inadequate to account for all that is contained in these romances. Not less inadequate is another theory, first suggested by Salmasius, and afterward elaborated by Warton, that the mediæval romance is mainly of Saracenic origin, and was probably introduced by the Moorish conquerors into Spain, and thence propagated into France and Britain; while a third theory, which has also found supporters, viz., that it was derived from the classical mythology of ancient Greece, is the most inadequate of all. The true explanation of the matter appears to be that mediæval romance had its root and foundation in chivalry (q.v.)—a genuine product of western Europe—and although the machinery, so to speak, the exploits and the marvels, may have often been derived from the foreign sources we have mentioned, yet the spirit, scenery, sentiment, and life of the legends thoroughly reflect the characteristics of the earlier ages of feudalism. The notions of dragons, giants, magic rings, enchanted castles, are probably of Saracenic origin, and may have been introduced into Europe by the horde of pilgrims who visited the east in the time of the crusades; such incidents as the detaining of a knight from his quest by the enchantments of a sorceress may have been a tradition of the *Odyssey* of Homer; but the gallantry, the courtesy, the romantic valor, the tournaments, the noble friendships of brother-knights—all that distinguishes the romances of chivalry from Runic legends, or the *Arabian Nights*, cannot be traced to any other source than the new-born chivalry of Europe.

The mediæval romances are divisible into three great series—1. Those relating to Arthur and the knights of the round-table. 2. Those relating to Charlemagne and his paladins. 3. Those relating to Amadis de Gaul, and his descendants.

The Arthurian series is, in its essence, of Welsh and Armoric origin. Its genesis is as follows: First came the legendary chronicles composed in Wales or Brittany, such as the *De Excidio Britanniæ* of Gildas (q.v.); the chronicle of Nennius, belonging to the 9th c.; the Armoric collections of Walter Calenius or Gualtier, archdeacon of Oxford; and the famous *Chronicon sive Historia Britonum* of Geoffrey of Monmouth (q.v.)—from these, and from the multitude of floating unrecorded traditions, sprung the *metrical*, which in turn gave birth to, and were ultimately superseded by, the *prose* romances. It is with the latter alone that we have here to do. They, like the metrical romances, were composed by Anglo-Norman authors (whose names are unknown) during the 13th, 14th, and 15th centuries, who took all the more willingly to the old British legend that in these the "Saxons" were the objects of the authors' hatred and detestation. The principal romances of the Arthurian cycle are those of *Merlin* (q.v.), the enchanter; of *Arthur*

(q.v.); of the Sangreal (see GRAAL); of *Perceval;* of *Lancelot du Lac;* of the princes of Lyonnesse, *Meliadus* and his son *Tristan;* and of *Isaie le Triste*, the son of Tristan. They relate the marvelous adventures, exploits, loves, and gallantries of the knights of the round-table, and are probably in substance the oldest of the mediæval prose romances. The scenes are generally laid in Wales, Cornwall, Brittany, Ireland, or Scotland; only in one or two of the series are we taken as far as Egypt or India; and though Arthur is slain by "Saracens" who supported his nephew, Mordred, and a general eastern coloring is present in the cycle, yet it is "Saxons" who are his principal foes.

The series of Charlemagne and his paladins is of purely French origin, and originated in a somewhat similar fashion to the Arthurian cycle; that is to say, there was first a legendary chronicle (in verse, however), entitled *Historia de Vita Caroli Magni et Rolandi*, erroneously attributed to Turpin or Tilpin, archbishop of Rheims, and contemporary of Charlemagne, but probably executed in the 11th or 12th centuries; then came a series of metrical romances, strictly so called, which were gradually supplanted by their prose counterparts, the authors of which last, however, appear to have diverged more from the metrical originals, and to have been more free and fanciful than their predecessors of the Arthurian cycle. The principal are *Huon of Bordeaux* (the incidents of which are followed by Wieland in his *Oberon*), *Guerin de Monglave, Gaylen Rhetoré* (in which Charlemagne and his paladins proceed *incognito* to the Holy Land), *Miles and Ames, Jourdain de Blaves, Doolin de Mayence, Ogier le Danois,* and *Maugis the Enchanter.* In these romances we are, in some respects, on totally different ground from that on which we find ourselves in the Arthurian series. We are transferred to the east—to Africa, Palestine, Arabia, Bagdad, Constantinople, India, Persia, the Caspian sea, etc. We are introduced to the courts of Saracen "princes," "sultans," and "emirs;" and see Mohammedan maidens of peerless beauty falling in love with Christian knights, and for their sakes abandoning, or even betraying father, mother, brethren, and kinsmen. Fairies, who figure but slightly in the Arthurian romances, play a frequent and an important part in these; demons, dervishes, apes, talismans, palaces with cupolas and gilded roofs, splendid jewels, diamonds, etc.—everything, in fact, shows the influence exercised on the imagination of western Europe by the glowing scenery, the brilliant life, and the gorgeously fanciful superstitions of oriental lands.

The series relating to Amadis de Gaul and his descendants is sufficiently characterized under the head of Amadis (q.v.). We may only observe, as a proof of the comparative lateness of their composition, that the "Saracens" of the French romances here give place to "Turks;" and as the eyes of Europe were turned toward the tottering Greek empire, many of the scenes of warfare are laid at Constantinople.

Besides the three distinct series of romance above-mentioned, a fourth, perhaps, deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of mediæval knights. The exact date of their composition cannot be ascertained; but they were probably later in general than any of the other three series; and, at any rate, were for the most part not published till the end of the 15th and the beginning of the 16th centuries. The principal are the romance of *Jason and Medea*, of *Hercules*, of *Œdipus*, and of *Alexander*. They are all written in French, and the first two profess to be the work of a Raoul le Febre. An attempt is made to adhere, in the general outline of the stories, to the ancient myths, but most marvelous embellishments are added, such as only the middle ages could have conceived; while the transformations that the classical personages undergo are exceedingly ludicrous. Jove becomes a "king;" Mercury his "squire;" the fates "duennas;" Cerberus and the sphinx, "giants;" etc.

Before leaving this division of our subject we would observe that, though the romances of chivalry may appear infinitely tedious and absurd to a modern reader, they were immensely relished and admired during the ages in which they were produced; were widely disseminated, in different forms, throughout all Christendom, and were highly popular with later poets. The influence which they exercised on Pulci, Boiardo, Tasso, Spenser, etc., shows the strong hold that they must have had on the imagination of Europe; but, with the decline of chivalry, the spread of the more rational and artistic fictions of the Italian novelists, the revival of letters, and the general advancement in civilization of Christendom, the taste for the romances of chivalry also declined, until finally Cervantes laughed them out of literature, and well-nigh out of memory, in the beginning of the 17th century.

3. *Development and Influence of Fiction in Italy.*—The Italians originated no romances of the kind described above. This resulted from various causes, the principal of which perhaps are: 1st, that they were really not a Gothic, but at least a semi-classic people; 2d, that they were more polished than the northern nations; and 3d, that instead of feudal chivalric institutions, the most characteristic *political* features of Italy, during the middle ages, were mercantile and lettered republics. There was what may be roughly called a *middle class*—of merchants—in Italy, when England and France and Spain contained really little more than nobles and serfs; and these were really the best instructed and the most enlightened portion of the community. Hence it is but natural that we should find a style of fiction mirroring to some extent this more civilized and sober form of social life. That the classical romances had some influence on the development of Italian fiction is probable; several of the tales recorded in the love-letters of Aristinetus, and in the *Golden Ass* of Appuleius, are quite like what we read in Boccaccio and others. The

fables of Pilpai or Bidpai (q.v.), translated into Latin as early as the 13th c., were also not without a certain effect; but it is to the Arabico-Indian book of the seven counselors (better known as *The Tales of the Seven Wise Masters*), still more to the stories of Petrus Alphonsus (whose work is entitled *De Clericale Disciplina*), and the *Gesta Romanorum* (q.v.), a grotesque jumble of classical stories, Arabian apologues, and monkish legends, in the disguise of romantic fiction; but most of all perhaps to the *Contes* and *Fabliaux* (q.v.) of the French poets, that we must look for the first sources of those almost innumerable *novelletti* which mark the earlier literary history of Italy.

The earliest Italian work of this sort is the *Cento Novelle Antiche*, commonly called *Il Novellino*. It is a compilation by different hands—all unknown—of stories floating about, or taken with modifications from the sources above-mentioned, with one or two of the more graceful episodes in the romances of chivalry, and was executed towards the close of the 13th century. It was followed in 1358 by the *Decameron* of Boccaccio (q.v.) —the finest, in point of humor, sentiment, and style, of the whole set, but not more original in the matter of story than *Il Novellino*. Its influence on early European literature was prodigious. Chaucer and Shakespeare in England have been in particular greatly indebted to it for incidents and plots; while in France—from whose Trouvères he had himself derived so much—Boccaccio had a number of distinguished imitators. In his own country his influence was so overwhelming that for some centuries Italian novelists could do nothing more than attempt to copy him. The principal of these imitators are Franco Sacchetti (1335–1410), Ser Giovanni (who began to write his novelletti in 1378, from which Molière got the plot of his *Ecole des Femmes*, and Shakespeare probably part of his story of the *Merchant of Venice*—though the story of the bond is far older, and is of Persian origin—Chaucer is also indebted to this Italian); Massuccio di Salerno (flor. about 1470), more original than most of the post-Boccaccian novelists; Sabadino delli Arienti (flor. about 1483); Agnolo Firenzuolo; Luigi da Porta; Molza, and Giovanni Brevio (flor. at the close of the 15th and in the first half of the 16th c.); Girolamo Parabosco (flor. 1550); Marco Cademoste da Lodi (1544); and Giovanni Giraldi Cinthio (died 1573), noted particularly for his extravagant employment of sanguinary incidents, and the introduction of scenes of incredible atrocity and accumulated horrors. The seventh of his third decade of stories contains the story of Othello, the Moor of Venice; the plot of *Measure for Measure* was also derived indirectly from him. Cinthio was, in fact, the greatest favorite of all the Italian novelists with the Elizabethan dramatists. Besides these, we may further mention Antonio Francesco Grazzini (died 1583); Straparolo (wrote 1554 *et seq.*) from whom Molière, and also the French writers of fairy tales, derived numerous hints; while the ludicrous incident embodied in the Scottish song of *The barrin' o' our door* forms one of the stories of this writer; Bandello (died 1555), the most widely known and read (out of Italy) of all the Italian novelists next to Boccaccio, and in whom we find the original of Massinger's play of *The Picture*, and of Shakespeare's *Twelfth Night;* Granucci (published 1574); Malespini (published 1609); and Campeggi (early part of 17th c.). The best French imitations of these Italian tales are the *Cent Nouvelles Nouvelles* (printed 1456, and translated into English under the title of the *Hundreth Mery Tayles*, 1557). They are full of life, gayety, and imagination, and are written in a most naïve and agreeable manner; and the *Heptameron* of Margaret, queen of Navarre, from which Shirley, the English dramatist, has taken the plots of two of his comedies.

A few words may also be devoted here in passing to a very different class of fiction —the *Spiritual Romance*. It originated, without doubt, in the bosom of the church, and from the desire to edify, by stories of religious knight-errantry, a rude and ignorant community, incapable of understanding or relishing abstract doctrines. The first of the series is *Barlaam and Josaphat*, already alluded to; but by far the greatest work of the kind produced during the middle ages is the *Legenda Aurea*, or Golden Legend (q.v.), itself believed to be drawn from different and now partly forgotten sources. Besides these may be mentioned a species of spiritual tale—the *Contes Dévots*, prevalent in France during the 12th and 13th c., and which were written by monks, probably with the view of counteracting the witty and licentious stories of the Trouvères; but curiously enough, in these pious fictions, the lives of monks and nuns are represented as far more immoral than in those of the secular satirists. The things, too, which the virgin Mary is represented as doing are most astounding, and throw a strange but valuable light upon the religious notions of the age. In one story she conceals the shame of a favorite nun; in another, she performs the part of a procuress; in a third, she officiates as midwife to an abbess who had been frail and imprudent; and in general, she performs the most degrading offices for the most worthless characters.

Romance of the 16*th and* 17*th Centuries.*—During the middle ages, the universal sway of the church and the institutions of feudalism gave a certain character of uniformity to the modes of life, and thereby to the social literature of western Europe; but after the epoch of the reformation, and even earlier, this uniformity disappears, and we find in every direction a tendency to the opposite extreme of individualism. This tendency manifests itself especially in the fiction of the period, which, vastly increasing in quantity and varying in quality, becomes difficult to classify. We shall, however, endeavor to group the products of modern prose-fiction works under what appears to us a convenient chronological heading.

During the 16th and 17th centuries, four different kinds of romance or novel were cultivated—1. *The Comic Romance;* 2. *The Political Romance*; 3. *The Pastoral Romance;* 4. *The Heroic Romance.*

Comic Romance substantially begins in modern times with Rabelais (q.v.), styled by sir William Temple the *father of ridicule.* Others, indeed, had preceded him in the same path, but they had acquired no celebrity. In him we see unmistakably one form of the modern spirit—its daring freedom of speculation, criticism, and satire, also that lack of reverence exhibited by those who, at the period of the reformation, clearly discerned the abuses of the church, but had not faith in the possibility or efficacy of reforms. Thus Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a skeptic, however) at the vices of the clergy, the crooked ways of politicians, the jargon of philosophers, and the absurdities of the *Contes Dévots*, and of the mediæval tales generally. The next remarkable romance of a comic nature is the *Vita di Bertoldo* of Julio Cesare Croce (flor. at the close of the 16th c.), a work recounting the humorous and successful exploits of a clever but ugly peasant, and regarding which we are told that for two centuries it was as popular in Italy as *Robinson Crusoe* or the *Pilgrim's Progress* in England. The substance of the story can be traced back to an oriental source. A few years later appeared *Don Quixote* (see CERVANTES), in which "war to the knife" was proclaimed against the romances of chivalry, and in which, perhaps, we see more distinctly than in any other fiction of the period the new *turn* that the mind of western Europe had taken. Almost contemporaneous with *Don Quixote* was another Spanish romance—Matteo Aleman's *Life of Guzman Alfarache*, successively beggar, swindler, pander, student, and galley-slave. In this work, as in others of the same sort, we find several indications of the influence of the Italian novelists. It has been supposed that *Guzman Alfarache* suggested to Le Sage the idea of *Gil Blas*, and there *is* some resemblance between the two; but, at any rate, it gave birth to a host of Spanish romances with beggars and scamps for heroes, of which the best is the *Lazarillo de Tormes*, by Diego de Mendoza (1586). In the following century France produced, among others, Scarron's *Roman Comique*, and Furetiere's *Roman Bourgeois.* England and Germany have nothing to show in this department.

Political Romance was manifestly suggested partly by the great politico-ecclesiastical changes that took place in Europe in the first half of the 16th c., and partly by the immense increase in the knowledge of the manners and customs of remote nations, occasioned by geographical discoveries and mercantile adventure. The earliest of the series is the *Utopia* of sir Thomas More; next comes the *Argenis* of Barclay, published in 1621; and to the same class belong a variety of French romances produced about the close of the 17th and the beginning of the 18th c., of which by far the most famous is the *Télémaque* of Fénelon.

Pastoral Romance.—All through the middle ages, the fame of Virgil kept up a certain interest in compositions devoted to the delineation of rustic or shepherd life. We even find in the poems of the troubadours several specimens of the erotic pastoral; and the *Ameto* of Boccaccio furnishes us with a prose illustration of the same. But it was after the revival of letters that this branch of fiction, so essentially classical, was most assiduously cultivated by men of scholarly genius; and though their works have not retained the popularity they originally enjoyed, they are still interesting and valuable from an historical point of view, and abound in descriptive passages of great beauty and sweetness. The pastoral life which they portray, however, never existed either in Greece or elsewhere. Their shepherds and shepherdesses are as unreal and unhistorical beings as the knights of mediæval romance. The first important work of the kind is the *Arcadia* of Sannazzaro, written in Italian about the end of the 15th century. It was followed by the *Diana* of Montemayor, written in Spanish, about the middle of the 16th c., several of the episodes of which are borrowed from the Italian novelists; while Shakespeare has in turn directly taken from it the plot of the *Two Gentlemen of Verona*, copying occasionally the very language, as well as some of the most amusing incidents in his *Midsummer Night's Dream.* The *Diana* was imitated in French by Honore d'Urfé, whose *Astrée* (1610–25) was for a long while held in the highest esteem, and is really, in spite of its tediousness, a work of great learning and considerable merit. Twenty years before the appearance of *Astrée*, sir Philip Sidney wrote and published his *Arcadia*, as tiresome, and in substance as unreal, as any production of the same school, but in stateliness and melody of language, in luxury of fancy, in nobility and purity of sentiment, far exceeding them all.

Heroic Romance owed its origin partly to the immediate antecedent pastoral romance, partly to an increased acquaintance with classic history, produced by the translation of such books as *Plutarch's Lives*, and partly to the interest excited in the Moors of Granada by a splendid romance in Spanish (professing, however, to be a *history*) entitled *The Dissensions of the Zegris and the Abencerrages*, and was printed at Alcala in 1604, and which soon became extremely popular, especially in France. It was in the latter country alone that the *Romans de Longue Haleine* (Long-winded Romances), as they have been happily nicknamed, were cultivated. The first of this heavy series was the *Polexandre* of Gomberville, published in 1632, in which the influence of the early Greek romances is visible. His successor, Calprenede, the best of a bad lot, wrote *Cleopatra*, *Cassandra*, and *Pharamond.* But the most prolific, and consequently the most intolera-

ble of the school, is Mme. de Scudéri, whose principal romances are *Ibrahim, ou l'Illustre Bassa; Clelie; Histoire Romaine; Artamenes, ou le Grand Cyrus;* and *Almahide.* The pompous dignity, the hyper-polite address, the dreadful dullness, and the hollow ceremonialism of these ridiculous performances, admirably (if unintentionally) mirror the features of French court-life during the time of the *Grand Monarque.* The heroic romances did not long retain their meretricious reputation. Molière, and still more, Boileau, in his satire *Les Héros de Roman, Dialogue,* ridiculed them to death, and in consequence, Mme. de Scudéri had no successor.

Novels and Romances of the 18th Century.—The two European nations that most brilliantly distinguished themselves in the department of fiction during this century were England and France, and to these we shall chiefly confine our attention.

1. *English Prose Fiction.*—During the age of Elizabeth and her immediate successors, the imaginative genius of England, from various causes, had taken an almost exclusively poetical direction, and with the exception of Sidney's pastoral of *Arcadia,* and Bunyan's *Pilgrim's Progress,* we meet with nothing in the shape of a novel or a romance for a hundred years. The 17th c. has nothing to show till it approaches its close. This is doubtless owing, in part at least, to the intensity of the great political struggle that agitated and rent England during the first half of that century, and gave an austere theological bias to society. The Puritans, in their day of triumph, would not tolerate either comic or heroic romances. They set their faces "like flint" against all imaginative fiction, which they considered as little better than lying; and even to this day that class of people commonly described as "the religious portion of the community," in some sense the representatives of the Puritans, betray the legitimacy of their spiritual descent by their aversion to all sorts of secular tales. After the restoration, however, an extraordinary change came over the English nation, or at least over the upper and wealthier classes. These rioted in the excess of a coarse and licentious reaction against the rigorous piety and fanaticism of the commonwealth. This turbid viciousness by and by calmed down, but it left a certain taint of sensualism and materialism in the habits and life of the people, which, in the opinion of some competent critics, marks them to this day. It is certain that at the beginning of the 18th c. England was entering on the most prosaic, unimaginative, and unheroical period of her history. Its characteristics are faithfully reflected in most of her novels, which, as pictures of the gross dull life, the paltry thoughts, the low sentiments, the modish manners, and the loose morality that prevailed, possess a great historical value apart altogether from their literary merits. The first name that occurs is that of the notorious *Aphra Behn* (q.v.), the greater number of whose novels, of which *Oronoko* is the best known, appeared towards the close of the reign of Charles II., but are included here in the literature of the 18th c., as they belong to it by the nature of their contents, and not to the 17th c. types of fiction. She was imitated by Mrs. Heywood (born 1696, died 1758), of whose *Love in Excess, The British Recluse,* and *The Injured Husband,* it has been remarked that "the male characters are in the highest degree licentious, and the females as impassioned as the Saracen princesses in the Spanish romances of chivalry." A later work, however, *The History of Miss Betsy Thoughtless,* is of a higher stamp, and is supposed to have suggested the plan of Miss Burney's *Evelina.* But the first novelist of great genius belonging to the new era is Daniel De Foe (q.v.), the father of modern English prose fiction, in whose writings—*The Adventures of Captain Singleton, The Fortunes of Moll Flanders, The History of Colonel Jack,* etc.—the coarse, homely, unpoetical, but vigorous *realism* of the time is strikingly apparent. Perhaps the Spanish ragamuffin romances may have furnished him with some hints. *Robinson Crusoe* is the finest and the most famous of all that class of fiction which was extensively cultivated both in France and England during the earlier part of the 18th c., and which received, in the former country, the name of *Voyages Imaginaires.* To the same class (outwardly at least) belong Swift's *Gulliver's Travels,* though at bottom this is a satirical romance, like the works of Rabelais, and the *Gaudentio di Lucca,* a sort of politico-geographical fiction, generally attributed to Bishop Berkeley. After De Foe comes Richardson (q.v.), very unlike any of the novelists of his age—to appearance! His muse is a most decorous prude, and never utters anything rude, or vulgar, or licentious; but though she was inspired with the best intentions, her notions of how virtue should be rewarded indicate the coarseness of the time, hardly less than the debaucheries and seductions of Fielding and Smollett. The principal novels of Richardson are, *Pamela; Sir Charles Grandison;* and *Clarissa Harlowe.* Fielding (q.v.) thought Richardson untrue to nature, and wrote his first novel of *Joseph Andrews* as a burlesque on the style of his predecessor. Like his subsequent performances, *Tom Jones* and *Amelia,* it represents society as Fielding's sharper eyes saw it, on the whole, gross, vulgar, and impure. Smollett (q.v.), with a different style of genius, continues to paint in the same spirit. His chief works are, *Roderick Random; Peregrine Pickle; The Adventures of Ferdinand Count Fathom;* and *Humphry Clinker.* Sterne (q.v.), belonging to the same period, exhibits a genius so whimsical, peculiar, and original, that it is almost impossible to class him with any of his contemporaries His *Tristram Shandy* is a work *sui generis,* but nowhere is the coarse impurity and indelicacy of the age more conspicuous. Four years later appeared Goldsmith's *Vicar of Wakefield,* in which a change for the better, in a moral point of view, is first noticeable. With the exception of Richard-

son, all the novelists above mentioned are usually, and we may add correctly, described as *humorists*. Other qualities they have besides, but this is the most common and predominant. When this school was passing away about 1760–70, another was on the eve of being born. The publication of Percy's *Reliques* had reawakened an interest in the age of chivalry and romance. Readers had become tired of the long prevalence of prosaic fiction, in spite of the splendid genius devoted to its illustration. It had done its work, and could create no more. The first of the modern romantic school was Horace Walpole, whose *Castle of Otranto* appeared in 1769. It was followed by Clara Reeve, the authoress of the *Old English Baron*, a romance that every school-boy, we hope, remembers with the deepest gratitude; but the greatest genius in this line was undoubtedly Mrs. Radcliffe (q.v.), whose *Mysteries of Udolpho* and other works, though now almost forgotten, were once greedily devoured and abundantly imitated. The ablest of her successors were Matthew Gregory Lewis, author of *The Monk* (1796), and Maturin, author of *Montorio* (1803). In all the romances of this school, the incidents are of the most startling, terrible, and often supernatural character, and the scenery is in keeping with the incidents. Fierce barons, mysterious bandits, persecuted maidens, gloomy castles, secret passages, deep forests, murders, ghosts, haunted chambers, etc.; everything that could charm, by way of contrast, and pleasantly horrify the languid, matter-of-fact, skeptical 18th c., is to be found in their exaggerated pages.

A few novelists remain to be mentioned who are incapable of particular classification. These are Dr. John Moore (q.v.), author of *Zeluco*, etc., Godwin (q.v.), author of *Caleb Williams*, *St. Leon*, etc., in whom the free-thinking and revolutionary spirit that seized many minds after 1789 is conspicuous; Mrs. Inchbald (*Nature and Art*, *A Simple Story*, etc.); Charlotte Smith (*Old Manor House*, etc.); Miss Austen (*Pride and Prejudice*, *Emma Persuasion*); and Maria Edgeworth, whose sketches of Irish character first suggested to Walter Scott—the idea of attempting for Scotland a series of like illustrations.

2. *French prose fiction in the 18th century.*—It is not easy—perhaps not possible—to trace the causes that led to the cultivation of the different kinds of fiction which flourished in France during this century, and particularly during the first half of it. The natural love of change—of novelty; the accidental influences of foreign literature; the disposition, so peculiarly French, to satirize prevalent follies and vices; the wish, on the other hand, to amuse the leisure moments of a luxurious, superstitious, and profligate society: all these and many other causes unquestionably assisted in determining its diverse development. Four kinds have been distinguished: 1. *Pseudo-historical Romance*, the literature in which department, although copious enough, neither deserves nor requires special notice. 2. *Romance in which the incidents, though natural, are purely imaginary.* 3. *Satirico-moral Romance.* 4. *Fairy Tales*, to which may be associated the imitations of *Oriental Tales*, and the *Voyages Imaginaires.*

2. *Romance in which the incidents, though natural, are purely imaginary.*—This class more nearly corresponds with the modern conception of the novel than any of its predecessors, and probably had its prototype in *La Princesse de Clèves* and *Zaide*, by the comtesse de Lafayette, who flourished in the latter half of the 17 c.; but the first great name that adorns it is that of Marivaux (1688—1763), whose *Vie de Mariamne* and *Paysan Parvenu* were long in high favor. They have this in common with the contemporary English fiction, that everything in them is produced by ordinary means, and the interest of the reader is sought to be awakened by the vivid and powerful portraiture of natural feelings, while the incidents, if often highly romantic, are always sufficiently probable to insure the credence of the imagination. Next to Marivaux comes the Abbé Prevot, q.v. (1693—1763), who first "carried the terrors of tragedy into the novel." He was a most voluminous writer, but the work by which he is now chiefly remembered is *Manon L'Escaut*, recounting the adventures of a kept-mistress and swindler, the purpose of which appears to be similar to that of *La Dame aux Camelias* of Dumas *fils*—viz., to show how noble, true-hearted, and self-sacrificing a prostitute may be! Other writers belonging more or less strictly to the same division are Madame Riccoboni (flor. 1750) and Rousseau (q.v.) in whose *Heloise* we begin to see the dawn of that fierce natural impure passion, and that extravagant scorn of conventional life, that culminated in the sanguinary paroxysms of the revolution.

3. *Humorous and satirical romance.*—By far the most celebrated specimens of this kind of fiction produced in France during the 18th c. are the *Gil Blas*, the *Diable Boiteux* and *Le Bachelier de Salamanque* of Le Sage, q.v. (1668—1746), all of which were suggested by the prolific comic romancists of Spain, Juan de Luna, Quevedo, Cervantes, Espinel, from some of whom he has borrowed, with hardly any variation, whole scenes and stories, as well as from more ancient sources. The best parts, however, are his own, and the spirit of the work is thoroughly French in the gay and lightsome vivacity of its humor. It is with some hesitation that we place the younger Crebillon (q.v.) in the same category, for the licentiousness of his *Egarements du Cœur et de l'Esprit*, and other novels, is far more apparent than their satire or humor. Bastide and Diderot (q.v.) hold an equally doubtful position as satirists or humorists; but Voltaire (q.v.) may fairly claim to rank among the former, in virtue of his *Candide*, *Zadig*, *L'Ingénu*, *La Princesse de Babylone*, etc., most of which contain covert attacks on superstition and despotism, under the forms in which Voltaire best knew them. Voltaire, however, had not a rich

imagination, and, in consequence, has been obliged to help himself liberally in the matter of incident from older writers.

4. *Fairy tales, etc.*—A very careful inquiry might probably succeed in tracing back this kind of literature to the early intercourse of Christian and Moorish nations, but the first work in which we find definite examples of fairy tales is the *Nights* of the Italian novelist Straparola, translated into French in 1585. In this collection are found at least the outlines of some of the best-known stories of the sort, such as *Le Chat Botté* (Puss in Boots), *Prince Marcassin*, *Blanchebelle*, and *Fortunatus*. The immediate forerunner and prototype, however, of the French fairy tales was the *Pentamerone* of Signor Basile, written in the Neapolitan *patois*, and published in 1672. This work attracted and stimulated the fancy of M. Charles Perrault (q.v.), whose *Histoires ou Contes du Temps passé* appeared in 1697, and is incomparably the most naïve and charming of all the collections of fairy tales. The titles of some of his *contes* will recall many a literary feast of our childhood—*La Barbe Bleue* (Bluebeard), *La Belle au Bois Dormant* (The Sleeping Beauty, to which, by the by, Tennyson has given a poetic immortality), *Le Chat Botté* (Puss in Boots), *Riquet à la Houppe* (Riquet with the Tuft), and *Le Petit Chaperon Rouge* (Little Red Riding Hood). The principal successors of Perrault were the comtesse d'Aunoy (see AUNOY), Madame Murat, and Mademoiselle de la Force; but their stories are much more extravagant and forced than those of the illustrious academician. The same censure, however, is not applicable to *Les Contes Marines* (1740), by Madame Villeneuve, among which occurs the tale entitled *La Belle et la Bête* (Beauty and the Beast), perhaps the most beautiful creation in the whole circle of this fantastic form of fiction.

Meanwhile, the translation of the *Arabian Nights' Entertainments* (q.v.) by Galland, 1704–17, and of numerous other Arabic and Persian works, the great encouragement extended to the literature of the East in the 17th and 18th centuries, the publication of the *Bibliothèque Orientale* of D'Herbelot, etc., created a taste for the brilliant exaggerations of oriental fiction, and a variety of works were soon in the field, swarming with necromancers, dervishes, caliphs, bashaws, viziers, cadis, eunuchs, slaves. The most notable of these are—*Les Mille et un Quart d'Heure, Contes Tartares; Les Contes Chinois, ou les Aventures Merveilleuses du Mandarin Fum-hoam;* and *Les Sultanes de Guzaratte, Contes Mongols*, of M. Gueulette.—Of the class of fictions known as *Voyages Imaginaires*, the principal are the *Histoire Comique des Estats et Empires de la Lune*, and the *Estats et Empires du Soleil* of Cyrano Bergerac, which materially influenced the genius of Swift, who has, in fact, borrowed not a little from the first of these in his *Gulliver's Travels*, and which were themselves partly suggested by the Spanish romance of Dominico Gonzales, entitled *The Man in the Moon*. Such novels as the *Paul et Virginie* of Bernardin St. Pierre, which appeared towards the end of the 18th c., do not come under any of the four heads, but may most conveniently be mentioned here.

Prose fiction of Germany during the 18th and 19th centuries.—The limits of our space will not permit us to do more than superficially indicate the development of this branch of literature in Germany, which, however, is the less to be regretted, as, during the greater part of the 18th c., it did not attain much distinction. Toward the close of the century, however, writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the 19th c., it will be most convenient and natural to treat both centuries together, as they, properly speaking, form only one era in the literary history of that nation.

The first eminent German novelist of this period was Wieland (q.v.), whose Greek romances, *Agathon*, *Aristippus*, *Socrates*, etc., are of that didactic and skeptical character which was beginning to mark the reflective genius of the continent, and which has since produced such immense changes in all departments of thought. Wieland was followed by a crowd of writers, in whose productions is more or less distinctly apparent the influence of the English novelists, particularly of Richardson and Fielding, who had been translated and carefully studied in Germany, where, however, the "novel of manners," whether serious or comic, dealt more largely in the representation of "family life." The principal names are August la Fontaine, Wetzel, Müller (whose *Siegfried von Lindenberg* is still remembered and read), Schulz, and Hippel. Almost contemporary with these quiet and somewhat prosaic novelists, there flourished for a brief period (1780–1800) a school of an entirely opposite character, whose works, fiercely and outrageously romantic, had their poetic counterpart in Schiller's *Robbers*. They resemble, in their style of handling the feudal ages, the English romances of Mrs. Radcliffe and others, which probably suggested them. The chief writers of this "turbulent school of fiction," as it has been called, are Cramer, Spiers, Schlenkert, and Veit Weber.

Alone, and far above all others in redundancy and originality of fancy, humor, and pathos, towers Jean Paul Richter (q.v.), who is incapable of classification, and to whom, therefore, his countrymen have affixed the epithet of *Der Einzige* (The Unique). Apart from all schools—in this respect, but in this only, like Richter—stands Johann Wolfgang Goethe (q.v.), whose novels, as well as his poems, are poetico-philosophic efforts to represent, perhaps to solve, the great facts and problems of human life and destiny.

The reaction from the materialism and irreligious levity of French thought, first showed itself in Germany toward the close of the 18th c., in a certain earnest love and study of the old, simple, superstitious, and poetical beliefs of the middle ages. Hence

originated the exquisite class of fictions called *Volksmährchen* (popular legends or tales), in which the Germans have never been equaled. The most illustrious cultivator of this species of fiction is Ludwig Tieck (q.v.), for Musæus (q.v.), though gifted with admirable powers of narration, is marked by a skeptical humor and irony, not altogether compatible with an imaginative conception of his subject. Other distinguished names are those of De la Motté Fouqué (q.v.), Chamisso (q.v.), Heinrich Steffens, Achim von Arnim (q.v.), Clemens Brentano (q.v.), Zschokke, and Hoffman (q.v.). More recent novelists of note are Auerback, Freytag, and Paul Heyse. The tales of Fritz Reuter, written in the *Platt* or Low German, are original and delightful.

Novels and Romances of the 19th Century.—These have been produced in such overwhelming quantity that volumes would be required merely to classify and characterize them. The vast and rapid increase in the material facilities of intercourse among European nations which has taken place during the last 40 years has, among other results, tended to diffuse through each country the literary products of all the others especially those of an entertaining kind; and these have in turn more or less stimulated the imagination of native genius, so that at present there is hardly a people in Europe, not even excluding Turkey, which has not contributed something to the enormous stock of fiction belonging to the 19th century. It would be altogether out of the question to attempt, in a compendious work like the present, a notice, however brief, of the principal novels and romances of every European nation; we can only refer to the historical surveys of literature, to be found under such heads as Belgium, Bohemia, Hungary, Netherlands, Norway, Poland, Sweden, Turkey, etc., and to individual biographies of eminent continental novelists. Even in regard to England and France, we can do little more than catalogue a few prominent names.

1. *English Fiction.*—Almost the first novelist that we encounter in the 19th c., sir Walter Scott (q.v.), is probably the greatest that England, or even the world, has ever seen. Here, however, we have less to do with his personal rank in literature than with the kind of fiction that he cultivated. In a qualified sense, he may be regarded as a continuation of the romantic school, but it must be observed that he is free from all their monstrosities, spasms, tricks, and horrible machinery. Possessed at once of far greater antiquarian learning, imaginative genius, sound sense, and instinctive taste than any of his "romantic" predecessors, he knew precisely what to shun and what to choose; and though his feudal age, as depicted in *Ivanhoe, The Fair Maid of Perth,* etc., is a considerably idealized portrait of the rugged facts, it *is* a portrait, and not like Horace Walpole's and Mrs. Radcliffe's performances, a furious caricature. The political reaction that took place in Britain, after the sanguinary excesses of the French revolution, assuming the form of a new and passionate attachment to venerable and time-honored traditions, showed itself in literature too, and sir Walter Scott was its grandest representative. He strove to delineate the past as it seemed in the eyes of men who were dubious of the present and afraid of the future—noble, stately, glittering, and gay, with the pulse of life ever beating to heroic measures. The overpowering genius of Scott necessarily but unhappily (for the comfort of readers) led to "endless imitation," but the only one of his followers that held for a time a tolerably decent position in literature is G. P. R. James (q.v.). Galt (q.v.) and Wilson (q.v.), the former with vulgar but racy humor, the latter with a highly sentimental and overdone pathos, portrayed aspects of Scottish life which the author of *Waverley* has passed over. Other novelists, such as Lockhart (q.v.), Miss Ferrier (q.v.), and Mrs. Johnstone, do not call for special notice; neither does Hope (q.v.), though his *Memoirs of Anastasius* is a most brilliant and powerful book; nor Moore (q.v.), though his *Epicurean* has all the sparkling and superficial splendors of his verse. After Scott, the next novelist who distinctly marks a new stage in the development of fiction is sir Edward Bulwer Lytton (q.v.), in whose earlier works at least we find something like a reflection of the cold, sneering, selfish, and sensual spirit that marked the upper classes during the period of the regency; but the versatile genius of this author, and the different fields in which he has won renown, would make it quite unfair to define him as a merely "fashionable" novelist, though his first and least meritorious distinctions were acquired in that capacity, and students of *Sartor Resartus* are apt to so remember him. Of fashionable novelists, strictly so called, the best-known are Mrs. Gore (q.v.) and Theodore Hook (q.v.). This class was succeeded by another infinitely worse than itself—the *Newgate novelists,* as they have been well termed, who sought for their heroes among highwaymen, thieves, desperadoes, and murderers, like Jack Sheppard, Blueskin, Dick Turpin, Claude Duval, etc., and, flagitiously indifferent alike to fact and morality, labored with pernicious success to invest the lives of these scoundrels with a halo of romantic interest and dignity. The chief of this school, "by merit raised to that bad eminence," is William Harrison Ainsworth (q.v.). During the last 30 years novels have been multiplied to a degree which is almost alarming, and literally incalculable. The greatest names are unquestionably those of Dickens (q.v.), Thackeray (q.v.), and Miss Evans (q.v.); but besides these might be mentioned a host of others, who have attained either celebrity or popularity, or both. Every mode of life, and every kind of opinion, social, artistic, scientific, philosophical, and religious, has sought to recommend itself by adopting this fascinating garb. We have the nautical novels of Marryat (q.v.), redolent, like Dibdin's songs, of the briny deep; the political novels of Disraeli (q.v.); the sporting and military novels of Lever (q.v.); the bril-

liant "muscular Christian" novels of Kingsley (q.v.); the "governess-novels," as they have been aptly denominated, of Miss Brontë (q.v.); the "school" novels of Hughes and Farrar; and the "sensational" novels of Wilkie Collins, Miss Braddon, and others. Other authors not less eminent, but not so easily classified, are Mrs. Gaskell, Mrs. Norton, Miss Mulock (now Mrs. Craik), Mrs. Oliphant (q.v.), Charles Reade (q.v.), George Macdonald; Meredith, Whyte-Melville, M'Carthy, Blackmore, "Ouida," are well known in various departments of fiction; and recently William Black has shown himself an artist of a high class. The extraordinary increase of this potent and therefore perilous branch of literature cannot fail to excite much curious reflection in thoughtful minds.

2. *French Fiction during the 19th Century.*—A few words are all that we can devote to this part of our subject, though it is far from uninteresting either in a literary or a moral point of view. The effect of the revolution of 1789 on literature was not immediately beneficial, but the reverse, though it planted the germs of a multitude of new thoughts and aspirations in the mind of Christendom, which have since yielded, both in France and elsewhere, a prolific harvest of wheat and—tares. The iron despotism of Napoleon crushed nearly all literary expression whatever. His hatred of "idealogues" is well known, but the novel was that species of idealogic composition that came least into collision with the principles of imperialism. Even *it*, however, could hardly be said to flourish; and the only tolerably gifted writer of fiction who figures during the first empire is Le Brun, and he was reduced to the necessity of caricaturing the *bourgeoisie*, to which Napoleon had no particular objection, as they were by no means his warmest admirers. Chateaubriand (q.v.) and Mme. de Staël (q.v.) are insignificant in this department, and Charles Nodier, though voluminous, was not an original novelist. After the return of the Bourbons, and especially after the revolution of 1830, France began to display a wonderful literary activity, and in particular, its long-repressed faculty of imagination burst into a sudden blossom of poetry and fiction. Even Napoleon, now that he was dead, received a peculiar homage from the class to whom he had never shown favor or regard, of which the songs of Béranger and *Les Misérables* of Victor Hugo afford us specimens. Unhappily for the purity of its literature, the *régime* of the restoration, which followed the deliverance of France from a military despotism, was itself a base, corrupt, and profligate thing. The Bourbons came back only to re-enact the follies of their ancestors in the previous century, and the nation soon came to despise, detest, and disbelieve them and the church which supported them. Hence a certain reckless levity and hollow mocking laughter, as of heartless skepticism, pervading those fictions which profess to delineate the realities of current life. Moreover, the sparkling wit, the sunny humor, the pathos, often exquisitely tender and refined, the delicate or deep delineation of character, the occasional fine flush of sentimental enthusiasm, and the poetic witchery of a religious mysticism, cannot blind us to the fact that the substance of most of the recent French fictions is incurably immoral. Paul de Kock (q.v.), Balzac (q.v,), Dumas (q.v.), father and son, Sue (q.v.), Dudevant (q.v.), Daudet, Zola, though wholly dissimilar in the quality of their genius, are in this respect too wofully alike. Victor Hugo (q.v.) and Lamartine (q.v.) are indeed morally far above the rest of their contemporaries, but they are perhaps the only great exceptions that can be mentioned. The "second empire" did not improve the tone of the French novel, any more than it improved the tone of French society; but if it be true that when things have reached their worst they begin to mend, the country that has produced *La Dame aux Camelias* is perhaps, as regards the literature of fiction, in a hopeful condition. The Erckmann-Chatrian tales, graphic delineations of provincial life, are honorably distinguished by the absence of all indecency. Verne's tales of impossible semi-scientific voyages to the moon and elsewhere are unique.

The prose fiction of Spain and Italy during the 19th c. scarcely requires notice, as the former country has not produced a single work that has forced its way into the general European market, while the latter can boast of only one that has attained that dignity, the *Promessi Sposi* of Manzoni (q.v.); but in a comprehensive sketch like the present, it would be a blemish to omit at least the names of the more eminent transatlantic novelists, as they have contributed not a little of late years to the stock of English prose fiction. The most notable are Brockden Brown (q.v.), the American Godwin; Fenimore Cooper (q.v.), from whom Europe has been content, on the whole not unwisely, to take its notions of the forests, the prairies, and the red men of the west; Washington Irving (q.v.), Edgar Allan Poe (q.v.), Nathaniel Hawthorne (q.v.), Mrs. Beecher Stowe (q.v.), Oliver Wendell Holmes (q.v.), and Brete Harte, in all of whose writings, except in the tales of Poe, is visible the influence of the life, traditions, scenery, and other salient characteristics of the new world. See Dunlop's *History of Fiction* (Lon. 1814), and Wolff's *Allgemeine Geschichte des Romans* (Jena, 1841, 2d edit. 1850). See *Supp.*, page 891.

NOVEMBER (Lat. *novem*, nine) was among the Romans the 9th month of the year, at the time when the year consisted of 10 months; and then contained 30 days. It subsequently was made to contain only 29, but Julius Cæsar gave it 31; and in the reign of Augustus the number was restored to 30, which number it has since retained. November was one of the most important months in connection with the religious ritual of the Romans, and continues in the same position, though for other reasons, in the Roman Catholic ritual. It was known among the Saxons as *Blot-monath*, "blood-month," on

account of the general slaughter of cattle at this time, for winter provision (known for a long time afterwards as *Martinmas beef*) and for sacrifice. This custom was not confined to the Saxons, but prevailed in northern Germany, and even as far south as Spain.

NOVGOROD', a government of great Russia, extends immediately s.e. of the government of St. Petersburg. Area, 48,780 sq. m.; pop. '80, 1,078,955. The surface is gently undulating, with the Valdai hills in the south, which rise to about 300 ft., and may be said to form the water-shed between the Baltic, Caspian, and White seas. The government contains many lakes and rivers; of the former, the lakes Ilmen and Bieloe are the largest; and of the latter, the Wolchof, Msta, Szeksna, and Mologa are the most important. The rivers are connected by canals, which are of great service to trade. The soil, especially in the n.e., is not fertile, and the climate is severe; agriculture and cattle-rearing are carried on only to a limited extent. Forests and pasture-lands are numerous and extensive, and the timber and hay sent to the capital realize a considerable income. Quarries of the best stone for paving occur on the river Tosna, and near Stara-Russa there are mineral and saline springs.

NOVGOROD, an important t. of European Russia, capital of the government of the same name, is situated on the Volkhof, near where it issues from lake Ilmen, 122 m. s.s.e. of St. Petersburg. It is the cradle of Russian history. In 862 the Norman prince Rurik, of the tribe of Variago-Ross (whence the name *Russia*), was invited hither by the neighboring tribes, and from him begins the history of the country, and the line of its sovereigns. A monument, commemorative of this event, was erected here, with great pomp, in Sept. 1862. In the 9th c. Oleg, the successor of Rurik, transported the capital to Kief; but bestowed many privileges and liberties upon Novgorod, and from that time it began to prosper. The greatness of Novgorod provoked the jealousy of the princes of Moscow, and in 1471 the czar Ivan III. nearly destroyed the town, bereft it of its liberties, and exiled the most influential citizens. During the time of its prosperity, the town was called Novgorod the Great; and had 400,000 inhabitants, and extended its sway to the White sea and the river Petchora. Its government was a sort of republic, the prince being less a sovereign than the chief commander of the troops. Its greatness was due to its vast foreign trade alone, and when Archangel was opened for English trading vessels, but especially after the foundation of St. Petersburg, its trade fell away, and the town rapidly declined. Of the existing ancient buildings, the most remarkable are the church of St. Sophia, founded in the 11th c., possessing a fine old library, as well as some remarkable paintings and tombs; and the Kreml, in the steeple of which hung the famous bell used to summon the citizens for the deliberation of state affairs. Pop. '80, 17,579.

NOVGOROD-SSJEWERSK, or NOVGOROD-SEVERSKO'IE, a t. of Russia, in the province of Tchernigov, 89 m. n.e. from Tchernigov, on the right bank of the Desna, a branch of the Dnieper. It is the capital of a district, and is a place of considerable trade and activity. Pop. '80, 6,500.

NOVGRAD'-VOLYNSKI', a t. of European Russia, in the government of Volhynia, 52 m. w.n.w. from Jitomir. It is the capital of a circle, and is situated on the banks of the Slutch, a feeder of the Pripet, and so of the Dnieper. Pop. '80, 8,900.

NO'VI, a t. of northern Italy, in the province of Genoa, is a station on the railway from Turin to Genoa, and is 33 m. n.n.w. of the latter city. It presents few attractions, with the exception of a number of picturesque old houses. It carries on a considerable transit trade; and the silk produced in the vicinity is amongst the most celebrated in Italy. Pop. 11,445.

NO'VIBAZAR', also JENIBAZAR, a t. of Bosnia, European Turkey, situated on the river Rashka, an affluent of the Morava, 130 m. s.e. of Bosna-Serai. Several of the great roads of the country cross each other here. Novibazar has celebrated fairs, important trade, and considerable wealth, but the houses are mostly of mud. It is the chief point of communication between Bosnia and the rest of Turkey. Pop. estimated at 15,000.

NOVICE. See NOVITIATE, *ante*.

NOVIKOFF, NIKOLAI IVANOVITCH, 1744–1818; b. Russia; entered the government service at the age of 18, but soon retired to devote himself to literature. One of his first publications was *The Painter*, containing satirical sketches of manners somewhat after the fashion of the *Spectator*. This was followed by his *Specimen of a Lexicon of Russian Authors*. These works won him the favor of the empress Catharine II., and he removed to Moscow, where he founded a typographical society, for the purpose of printing cheap books. He organized the first circulating library in Russia, but was obliged to leave Moscow, as a supposed adherent of the French philosophers. He published 1773–75 a collection of historical materials, called *The Old Russian Library*.

NOVITIATE, the time of probation, as well as preparatory training, which in all religious orders precedes the solemn PROFESSION (q.v.). Under the head of MONACHISM will be found the general principles by which the training for the "religious" life is regulated. It will be enough to say here, that the novitiate in all orders must continue (Conc. Trid. Sess. XXV. c. 85, *De Regul. and Mon.*) at least one year. In most orders it is

of two, and in several of three. Any attempt to solemnize the profession before the expiration of the noviate, without a dispensation, is invalid. During the novitiate, the novices are immediately subject to a superior, called master (or mistress) of novices. They are not permitted to engage in systematic study, their whole time being devoted to prayer, and to ascetic and liturgical training. During the novitiate, the novice continues free to withdraw, nor is he or she admitted to profession at the close of the novitiate, except after proof given of fitness, and of proper dispositions for the particular institute aspired to.

NOVOARKHANGHELSK' (New Archangel), or SITKA, a seaport of Alaska, formerly center of the administration of the Russo-American company, situated on the island of Sitka, on the n.w. coast of the American continent, in lat. 57° 3′ n., long. about 135° west. It has a good port, and was the entrepôt of all the stores for the other Russo-American colonies, and of their produce, of which furs were the principal item. There are at Novoarkhanghelsk only 66 clear days in the year. Mean temperature throughout the year, 43° 45′ F. Pop. (before cession of Alaska to the U.S.) 1,000, mostly servants of the company.

NOVO GEORG'IEVSKI, a t. in Russian Poland, at the junction of the Bug and Vistula rivers, 19 m. n.w. of Warsaw; pop. 10,225. It was founded in 1809, by Napoleon, who gave the name of Modlin, which was changed to the present name by the Russians, when they gained possession of it after the fall of Warsaw in 1831. It had also been in the hands of the Russians, 1813–30, when the Polish revolutionists seized it. It is a strongly fortified post, with an arsenal and citadel.

NOVOMOSKOVSK', an important market-t. of s. Russia, in the government of Ekaterinoslav, and 20 m. n.n.e. of the town of that name, on the Samara, an affluent of the Dnieper. Three extensive fairs, chiefly for the sale of cattle and horses, are held here annually. The "remounting" officers attend these fairs for the purpose of supplying their regiments with horses. Tanning and tallow-melting are carried on. Pop. '80, 10,515.

NOVOTCHERKASK', a t. of s. Russia, capital of the territory of the Cossacks of the Don, on the Aksaï, a tributary of the Don, at a distance of 12 m. from its right bank, and about 70 m. e.n.e. of Taganrog. The central administration of the territory was transferred hither from Tcherkask in 1804 by count Platoff, commander-in-chief of the Cossacks. The choice was not a happy one, the distance of the town from the Don, the great commercial artery, being much felt. In 1855, a statue was erected in memory of count Platoff, who achieved an illustrious name by his military exploits from 1770 till 1816, and especially during the French invasion in 1812. Pop. '80, 37,091, who carry on trade and manufactures, agriculture, cattle-breeding, fishing, and wine-growing.

NO'VUM ORGANUM, or The New Instrument, lord Bacon's treatise sketching the inductive method of studying nature, which before his time had been pursued only occasionally and blindly—a method whose introduction divides philosophy into the old and the new. I. Bacon in the first part of his work surveys the imperfections of human knowledge. 1. He notes the vagueness and uncertainty of all speculation, and the want of connection between the sciences and the arts, due to "the perverseness and insufficiency of the methods pursued." "If men had consulted experience and observation, they would have had facts, and not opinions, to reason about." The method then in vogue he describes as "ill-suited to discovery, but wonderfully accommodated to debate." 2. He enumerates the causes of error, naming them in the figurative language so commonly employed by him—*idols*, things to which the mind had long been accustomed to bow down; of these he shows four classes: (1.) Idols of the *tribe* or of the race: causes of error found in human nature in general; such as man's propensity to find in nature a greater degree of order and regularity than actually exists. Thus, as soon as men perceived that the orbits of the planets were returning curves, they assumed them to be perfect circles, and the motion in them to be uniform; and to these false suppositions the ancient astronomers labored to reconcile the facts which they observed. (2.) Idols of the *den:* causes of error springing from individual character, as if each person had his own cavern or den, into which light imperfectly enters; some minds being best fitted to mark differences, others resemblances, etc. (3.) Idols of the *forum:* causes of error arising out of public and social intercourse, and especially out of its implement—language. Men believe that their thoughts govern words; while often their words govern their thoughts, and few abstract terms convey precise and well-defined ideas. (4). Idols of the *theater:* causes of error arising from the systems or doctrines of particular schools, which are like imaginary worlds brought upon the stage, yet influencing the mind as if they were real. 3. Bacon, pointing out the circumstances which had favored these perverse methods, (1) notes three periods of pursuit of science—the Grecian, Roman, and European—after the revival of letters: the first, short; the second, disturbed in its earlier part by politics and war, and, after the rise of Christianity, by religious interests and theological pursuits; the third, overshadowed by royal and hierarchical power enslaving the mind. In his opinion no part of knowledge could make much progress if its start was not made from facts in nature. (2.) He shows that the end and object of knowledge had been misunderstood; that some had pursued the knowledge of words rather than of

things; some, of objects imaginary and unattainable, promising to prolong life indefinitely, to extinguish disease, and to rule the spiritual world by magical charms. "All this is the mere boasting of ignorance; for, when the knowledge of nature shall be rightly pursued, it will lead to discoveries that will as far excel the pretended powers of magic, as the real exploits of Cæsar and Alexander exceed the fabulous adventures of Arthur of Britain or Amadis of Gaul." (3.) Reverence for antiquity and the authority of great names had greatly retarded the progress of knowledge: the "older times" were really the young and inexperienced times; the latest age is the oldest; having gathered the most of facts and experiences. (4.) Knowledge has been greatly hindered by the fact that in general men have inquired only into the causes of rare and great phenomena, without troubling themselves about the explanation of such as are common, and make a part of the general course of nature; while the laws always in action are those which it is most important to understand. It was an error of the same sort which had led men to delight in mere contemplation and to regard manual experiment as beneath the dignity of science.

II. The second book of the *Novum Organum* treats of the induction essential to the right interpretation of nature. 1. A history full and accurate of the phenomena concerned must be prepared—a "natural history." 2. There must be a comparison of the various facts to find out the cause of a phenomenon—its "form or essence;" also, to discover the invisible processes and the invisible structure of the bodies concerned. 3. The facts being in hand, consideration is then to be had of them as to what things are by these facts excluded from the number of possible causes. After many such exclusions have left but a few principles common to every case, one of these is to be assumed as the cause, and the trial is to be made by synthetical reasoning whether it will account for the phenomenon. This proeess by exclusion—through successive negatives to the final affirmative—Bacon regarded as essential to success. 4. This method of induction he declared to be applicable to all investigations where experience is the guide, whether in the physical or moral world.

NOWANAGAR, or NOWANUGGUR, a seaport of India, in the peninsula of Kattywar, Guzerat, at the mouth of the Nagna, a small river on the s. shore of the gulf of Cutch, 160 m. w.s.w. from Ahmedabad, and in n. lat. 22° 28′, e. long. 70° 11′. It is the principal place of the district of Hallar, the greater part of which is held as a *jaghire* by the chief of Nowanagar, who bears the title of the jam of Nowanagar. His territory comprises 540 villages, and a pop. of about 290,000. The town of Nowanagar is large and populous, nearly 4. m. in circuit. It is a place of very active trade, famous for the fine quality of the cloth which it produces, and for the brilliant colors of which its fabrics are dyed. In the adjacent sea are beds of pearl oysters. Copper ore has been discovered in a range of hills behind the town.

NOWELL, INCREASE, 1590–1655; b. England; having been chosen an assistant of the proposed colony of Massachusetts bay, upon the formation of the company he came to this country with Winthrop in 1630, and became an elder in the rev. John Wilson's church. He was commissioner of military affairs during the first Pequot war in 1634, and secretary of the colony, 1636–49.

NOX, in mythology, daughter of Chaos and mother, by her brother Erebus, of Æther (the air) and Hemera (day). She was also the mother of the Fates, of Death, Dreams, Nemesis, Fraud, the Hesperides, etc. The victims sacrificed to her were a black sheep and a cock. The poets called her mother of all things, and Homer represents Zeus as standing in fear of her. There was a famous statue of her by Rhoecus in the temple of Diana at Ephesus, and her attributes seem to have been blended with those of the moon goddess. She is represented as riding in a chariot with the constellations going before her, and wearing a starry veil, or with two children in her arms, one black representing death, one white representing sleep, or as riding in a chariot drawn by bats and owls, and dressed in mourning, with a crown of poppies on her head.

NOXUBEE, a co. in e. central Mississippi, bordering on Alabama; intersected by the Tombigbee and its branch the Noxubee, rivers, and by the Mobile and Ohio railroad; about 650 sq.m.; pop. '80, 29,874—29,784 of American birth, 24,574 colored. The surface is level, with extensive forests, including, besides many hard-wood trees, the cypress, magnolia, and tulip trees. The soil is very rich. Indian corn, cotton, and pork are staples. Co. seat, Macon.

NOYADES (i.e., "drownings," from Fr. *noyer*, to drown), the execution of political offenders in great numbers at once by drowning them, one of the atrocities of the French revolution, practiced at Nantes by Carrier, the deputy of the convention. See CARRIER. This mode of execution was also called, in cruel sport, *vertical deportation* .

NOYAU. See LIQUEUR.

NOYES, EDWARD FOLLANSBEE. See page 892.

NOYES, ELI, D.D., 1814–54, b. Me. He was self-educated, and began to preach in 1834; he embarked with his wife, Sept. 22, 1835, for Calcutta, and settled at Orissa, where he had great success in mission work. In 1841 he returned with impaired health, and for several years was pastor of a Free-will Baptist church, in Boston. He edited for 10 years the *Morning Star*, the Free-will Baptist organ. He published *Lectures on the Truths of the Bible; A Hebrew Grammar and Reader.*

NOYES, George Rapall, d.d., 1798–1868; b. Mass; graduated at Harvard college in 1818, and afterwards at the Harvard divinity school. In 1827 he was settled over a Unitarian church in Brookfield, Mass., from which he removed to a church in Petersham. During this time he pursued the study of the biblical text in the original languages, and was recognized as one of the first Hebrew scholars in America. In 1840 he was appointed Hancock professor of the oriental languages in Harvard college, and Dexter lecturer on biblical literature. He published in 1827 *An Amended Version of the Book of Job; A New Translation of the Hebrew Prophets*, 1833–37; *A New Translation of the Prophets, Ecclesiastes, and the Canticles*, 1846; *Theological Essays*, 1856; and a *Translation of the New Testament*, issued by the American Unitarian association in 1869.

NOYES, John Humphrey, b. Vt., 1811; graduated at Dartmouth college; studied theology at Andover and New Haven; was licensed to preach in 1833. In 1834, announcing himself a Perfectionist, his license to preach was recalled, and he began to propagate his new views in various periodicals. He has published several volumes, the most important of which are *The Berean; The Second Coming of Christ; Salvation from Sin; Bible Communism; Male Continence and Scientific Propagation; History of American Socialisms.* In 1838 he founded a community of Perfectionists at Putney, Vt.; removed in 1847 to Lenox, Madison co., N. Y., and established the Oneida Community. He afterwards established another branch at Wallingford, Conn. The Perfectionists practice community of women as well as of goods, and maintain the full equality of the sexes in social and business life. They are profitably engaged in farming and manufactures, and have two printing-offices. Recently the public indignation against the sexual immorality of their system has taken such stern expression and such legal attitude that the practical abandonment of their indecent theories has been announced. Noyes is a man of fascinating manners and fine literary taste.

NOYES, William Curtis, ll.d., 1805–64; b. Shodack, N. Y.; began the practice of law in 1827 in Oneida co., where he quickly took high rank. He removed to New York in 1838, and immediately took a place among eminent lawyers, and was at one time engaged to codify the laws of the state. In politics he was an antislavery whig. And on the organization of the republican party became a member of it; but was drawn into the futile and temporizing peace convention of 1861. He was elected president of the New England society the day before his death, which took place in New York, Dec. 25, 1864. He bequeated a valuable law library to Hamilton college.

NOYON, a t. of France in the department of Oise, 78 m. n.n.e. of Paris by the Northern railway. It has a fine cathedral of the 12th and 13th centuries, in the Romanesque style of architecture; an episcopal palace, and some linen and cotton manufactures; Pop. '76, 5,785. Noyon was a residence of Charlemagne, and the place where Hugo Capet was crowned king of France in 987. It is also noted as the birthplace of John Calvin.

NUBAR PASHA. See page 892.

NU'BIA, the modern appellation of a country subject to the khedive of Egypt, extending from Philae to the Sennaar, lat. 18° s., bounded on the e. by the Arabian gulf, n. by Egypt, s. by Abyssinia, and on the w. by the desert. It appears to have been anciently known as Ethiopia. The ancients gave the name of Ethiopia to the w. bank of the Nile from Meroë to the bend of the river. The name seems to have been derived from the Egyptian and Coptic *noub*, or gold, a name still retained in *Wady Nouba*, which extends from the frontier of Dongola, n. of the *Wady Seboua*, above Derri. The tract between Seboua and Assouan is called the Wady Kenous. Diocletian removed hither a Libyan tribe, called Nobatæ, to the district above Syene, to oppose the Blemmyes, who inhabited the western desert, now held by the Ababde and Bisharein Arabs. The dominion of the Pharaohs, when most extended, reached to the isle of Argo, the last place where the monuments of the Egyptians have been found. Under these monarchs it was called Cush, and was governed by a royal scribe, entitled prince of Cush or Ethiopia, till the twentieth dynasty, when it appears to have been recovered by a series of native rulers, who ultimately conquered Egypt; and although driven back, finally extended their rule from Meroë to Syene, the most southern city held by the Egyptian monarchs, the Ptolemies, and the Romans. These Ethiopians adopted the civilization of the Egyptians, and the names of some of their monarchs have been preserved. The subsequent fortunes of this country will be seen under Ethiopia. The modern inhabitants consist principally of Arabs, who invaded the country after the rise of Mohammed, the principal tribes being the Djowabere and El Gharbye, who inhabit from Assouan to the Wady Halfa; the Kenous, Djaafere, and others, a branch of the Koreish, who occupied the land from Esne to Assouan. By the aid of Bosnian soldiers the Djowabere were driven into Dongola in the reign of Selim; and their descendants still flourish at Ibrim, Assouan and Sai. Lower down inhabit a race called the Berbers or Barabras; s. of Cossier are the Ababde. From Dongola and Sennaar, a negro state, the people are called Noubas, a hardy race, differing from the pure blacks; but the country throughout is inhabited by mixed races of Arabian and Nigritic blood. Another tribe, the Sheygya, e. of Dongola—a fine black race, addicted to horsemanship and war—are still more interesting. The Ababde Arabs are renowned as guides and camel drivers; the Bisharein are supposed by some to be the ancient Blemmyes, a tribe living on flesh and milk, but without the oriental jealousy of the Arabs; the Takas, supposed

to be the ancient Bojahs, dwell in the mountains. Three principal languages are spoken by these various tribes—the Nuba by the Berbers, who entered from the s.w.; the Kungara, a Nigritic dialect, by the negroes of Dafur; and the Bisharie, said to exhibit Aryan affinities. The inhabitants, estimated at about 1,000,000, although less in stature than the Egyptians, are a fine muscular race; the women are pleasing, but not beautiful; and the climate is remarkably healthy. In their political government they were governed by their own chiefs, *maks* or *malechs*, till they were subdued by Ismael Pasha, in 1820, to the sway of Egypt, and the civil government is now administered by the Turks. The country is arid, in many places only cultivable at the sides of the Nile, and consists of granite and sandstone. The soil raises durra, cotton, and date palms. It is traversed by the *Bahr-el-Azrek*, or Blue Nile, and the *Bahr-el-Abiad*, or White Nile. The products are numerous, comprising maize, dates, tamarinds, gums, aloes, civet, musk, wax, myrrh, frankincense, senna, black wool, hides both of the elephant and rhinoceros, and their ivory; ostrich feathers, ebony, gold dust, saltpeter, salt, tobacco, coffee, cotton—which are carried by way of commerce to Egypt. The taxes are rated by the number of water wheels for the irrigation of the land. There being no native currency, the coins of Egypt and Europe, especially the Spanish dollar, are received, but glass beads, coral, cloth, *tobs* or shirts, and cloth (*samoor*) also pass as money. In Kordofan value is reckoned by cows. The most primitive modes of measurement are in use, maize being sold by the handful (*selga*), 18 of which go to a *moud;* and cloth being measured from the elbow to the fingers. Polygamy is general, and a wife at Kenous is purchased of her parents for 30 piastres; amongst the Arabs for 6 camels, 3 of which are returned to the bridegroom. Some of the tribes are jealous of their women, who are celebrated by travelers on account of their virtue. In their costume they use turbans, linen, and woolen garments, and are armed with lance and shield, the latter made of the hide of the hippopotamus. No looms exist, but they plait neatly. Their chief musical instrument is a guitar of five strings with sounding-board of a gazelle's hide. They are generally averse to commerce, eat little animal food, and are Mohammedans. Their houses are low huts of mud or stone. The chief attraction of this country to travelers is the numerous temples and other ancient remains of the Egyptians, extending from Philae to the island of Argo. These consist of the temple of Isis, in the isle of Philae, founded by Nectanebo, I., and continued by the Ptolemies; the temple of Deboud, built in honor of Amen Ra, by Ataramen, and continued by the Romans; Tafa or Taphis, the modern Kalabshe, built by Rameses II.; the rock temple of Beit e Welly, recording the conquests of the same monarch; Wady Halfa, built by Osertesen I.; the rock temple of Ib samboul, built by Rameses II.; Gebel Addeh, built by Horus of the eighteenth dynasty; Ibrim, built by Amenophes II.; Amada, founded by Thothmes III.; Ghersheh, Seboua, and Derri, built by Rameses II.; Dakkeh, the ancient Pselcis, built by Ergamenes; and the colossus of the isle of Argo; the pyramids of Meroë and Tanquassi.—Burckhardt, *Travels;* Champollion le Jeune, *Lettres Ecrites*, p. 107, and foll.; Lepsius, *Reise*, p. 107, and foll.

ÑUBLE, a small inland department of Chili on the w. slope of the Andes, bounded n. by the river Maule, e. by the Andes, s. by the Nuble river, which flows into the Itata, and w. by the department of Maule, which lies between it and the Pacific; 3,700 sq.m.; pop. 128,182. It is one of the most fertile and prolific parts of Chili. Its climate is suited to grain, to the fruits of the temperate zone, to the vine for wine-making, and to grazing and the rearing of horses. Capital, Chillau.

NU'CHA or **NUKHA**, a t. of Russia; after Tiflis and Shemacha, the most important town of Transcaucasia, and the only town of the former khanat of Nucha or Sheki, in the n.w. of Shirwan. It is 120 m. e.s.e. from Tiflis, and stands at the southern base of Caucasus in the valley of the Kish-Tshai, an affluent of the Alasan, which itself is a branch of the Kur. Pop. '80, 25,000. The town is surrounded by mulberry groves and fruit gardens, extending to a distance of several miles. It has long been famous for the rearing of silk worms, silk spinning, and the manufacture of silken goods.

NUCKOLLS, a co. in s. Nebraska, adjoining Kansas, drained by the Little Blue and Republican rivers; 576 sq.m.; pop. '80, 4,235—3,779 of American birth. The surface is mostly prairie, with little timber. It produces good crops of grass, and is suitable for agriculture or grazing. Co. seat, Nelson.

NUCLEOBRANCHIA'TA, or HETEROPODA, an order of gasteropods having the sexes distinct; the locomotive organ fin-like, single, and ventral; the gills packed in small compass along with the heart. They are all marine, and usually swim with the back downwards and the fin-shaped foot upwards. They adhere to sea-weeds by a small sucker placed on the fin. Some of them, as *Atlanta*, have a shell large enough to protect the body; some, as *Carinaria*, have a small shell covering the gills and heart only; and some, as *Firola*, have no shell at all.

NU'CLEUS. See CELLS.

NUDIBRANCHIA'TA (naked-gilled), an order of gasteropods, hermaphrodite, destitute of shell, and having the gills exposed on the surface of the body. The gills are differently situated in different genera. The genus *Doris* (q.v.) is an example of this order.

NUE'CES, a river of Texas, rises in south-western Texas, lat. 30°, long. 101° w., and after a south-easterly course of 300 m., flows into Corpus Christi bay, and through the pass of the same name into the gulf of Mexico.

NUE'CES, a co. in s. Texas, on the gulf of Mexico, s. of the Nueces river, drained by the Santa Gertrudis river and others; 2,800 sq.m.; pop. '80, 7,669—4,410 of American birth, 628 colored. The surface is mostly level, and the soil a rich loam. There is not sufficient rain for agriculture, but the county is admirably adapted for cattle and sheep raising. Large quantities of wool are produced. Corpus Christi bay on the n.e., and numerous other inlets afford good fishing. Co. seat, Corpus Christi.

NUEVA SPARTA. See MARGARITA, *ante*.

NUEVO LEON, a Mexican state bounded n. by the Rio Grande, e. by Tamaulipas, s. by San Luis Potosi and Zacatecas, and w. by Coahuila; between 24° and 27° 30′ n. lat., and 99° and 100° 40′ w. long.; about 20,000 sq.m.; pop. about 180,000. The surface is irregular and mountainous, and in the s. is made up of table-lands. The chief rivers are the Tigre and other branches of the Rio Grande. In the valleys are extensive forest and pasture lands, as well as good soil for cultivation. The soil would be very fertile were it well watered; maize (three crops), sugar cane, and wheat are the staples. There are mines of gold, silver, lead, copper, iron, and salt, but none fully developed. Marble, alabaster, and sulphur are also found. There are large manufactories of boots, shoes, leather, hats, and cotton cloth. The climate is hot and unhealthy, except in the higher districts. Nuevo Leon is divided into nine districts: Monterey, Cadereita, Villaldama, Salinas, Garcia, Victoria, Morelos, Doctor Arroyo, Linares, and Cerralvo. The capital is Monterey; Florida, Saltillo, Morelos, and Linares are important towns.

NUGGI'NA, a t. of British India, in the district of Bijnur, division of Rohilcund, n.w. provinces. It is 48 m. n.n.w. from Moradabad, on the route from Moradabad to Hurdwar. Nuggina is the Birmingham of upper India, and is famous in modern times for the manufacture not only of gun-barrels but of percussion-locks. Pop. '72, 19,696.

***NUISANCE** is a legal term used to denote whatever is an annoyance to one's neighbors, or in a general sense to the public at large, in the exercise of their rights of property. The whole doctrine of nuisance is founded on the theory that every person is entitled to have the full use and enjoyment of his property, and of the right of passing to and fro on the highway without being interfered with or impeded by others, and whatever so impedes this full enjoyment of one's property and right of passage on the highway is a nuisance. Nuisances are thus capable of being divided into two kinds—private and public. Thus, if a neighbor leave a heap of rubbish emitting noxious smells close to A's windows, or make loud noises in his house, these may be said to be private nuisances, for they annoy A in the enjoyment of the fresh air and quiet which are part of his right of property. On the other hand, if something is put of the same kind on a public highway, or so as to annoy divers people equally and in the same manner, then it is called a public nuisance. One of the leading incidents of a nuisance is that the party annoyed by it can in many cases, especially where the nuisance is injurious to health or life, take the law into his own hands and abate the nuisance without resorting to a court of law. The reason is that the matter is of too urgent importance to await the slow progress of a suit at law, and mischief may be done in the mean time which would be often irreparable owing to the delay. Another important qualification of the right of abating a nuisance is that the nuisance must be such that unless it is abated at once the party cannot exercise his legal rights; and hence if the nuisance is of such a kind that it does not directly interfere with the comfort or enjoyment of one's legal rights at the time, he has no right to abate it, but in that case is bound to resort to a court of law. This is best illustrated in the case of a nuisance on the highway, which is the class of cases in which the phrase a common nuisance is most familiarly known. Thus if while A is riding or driving along the highway his progress is interrupted by a fence or gate which nobody has a legal right to put there, it is obvious that unless A can knock down or demolish at once this obstruction he cannot proceed in the exercise of his legal right of using the highway. In such a case he has a right to demolish the gate and abate the nuisance, for it directly interferes with his own legal right. But if instead, a gate, a booth, or tent had been erected, not across the highway, but merely on one side of it, so as to leave room for passengers to pass, then, though such tent or booth would be as undoubted a nuisance as in the other case, yet inasmuch as A can pass without direct interference, he has no right to abate the nuisance by destroying the tent. He must, in this latter case, resort to the legal remedy only. The same rule applies to all kinds of nuisances.

Another rule is that in abating a nuisance the party is not to do unnecessary damage to property, i.e., more than simply abate the nuisance to such an extent as to enable himself to exercise his legal right, and no further. If he go beyond the immediate occasion, and cause unnecessary destruction to property, then he subjects himself to an action of damages. Hence it is often a difficult thing to know when one is justified in abating a nuisance and taking the law into his own hands.

Where the nuisance is sought to be removed by legal means, then the remedy is in some cases two-fold, and in some cases not so. Where the nuisance is of a private

nature, an action of damages is in general the only remedy given by the common law. But where the nuisance is public, and affects all the public equally, or nearly so, then in general either an action may be brought, or an indictment will lie. Thus in case of a nuisance on a highway, as this affects all the lieges alike, an indictment is the proper remedy, though if an individual suffered special damage over and above what he suffers as one of the public, then he may bring an action. In Scotland, instead of an indictment, an action in the nature of a public action is raised, which is substantially similar in its results to an indictment.

As will be seen from what has preceded, the legal remedy in cases of nuisances has long been felt to be insufficient. To add to the other defects, there is great difficulty in determining whether a particular mode of using one's premises is in the nature of a nuisance or not; for if the line is drawn too narrowly, the rights of property and the natural freedom of the subject may be interfered with. On the other hand, things which formerly were considered no nuisances are now treated as such, owing to the spread of more enlightened views of public health and habits of cleanliness. These considerations recently induced the legislature to alter the common law in an important degree, and substitute a new code under the name of the public health and nuisances removal acts, 11 and 12 Vict. c. 63; 18 and 19 Vict. c. 116; 35 and 36 Vict. c. 79. The general scheme of these acts is to enable districts to appoint local boards, with extensive powers of self-government, and to undertake and execute sanitary improvements, such as drainage and water supply on a large scale, paying for the expense thereof by a local rate or assessment.

As regards the power of removing nuisances, a statute was passed in 1855 for England, called the nuisances removal act, which has been amended by two subsequent acts. By these acts, some sanitary authority, called rural or urban, under 35 and 36 Vict. c. 79, is appointed the local authority for carrying out the provisions of the act, and these are of an extensive kind. The act defines a nuisance to include any premises in such a state as to be a nuisance or injurious to health; any pool, ditch, gutter, water-course, privy, urinal, cess-pool, drain, or ashpit, so foul as be a nuisance or injurious to health; any animal so kept as to be a nuisance, or injurious to health; and any accumulation or deposit, overcrowding, foul condition, or smoke. The local authority is to appoint a sanitary inspector at a proper salary. Any person aggrieved may give notice to the local board, or the sanitary inspector may do so. The local board has extensive powers; it can authorize its inspector, on reasonable complaint, to demand an entrance into any private premises so as to inspect their condition, and may order the removal of nuisances found to exist there. The local board, on finding a nuisance exists, direct their officer to go before a justice of the peace and procure an order directing the private party to abate the nuisance. If he refuse to do so, the local board may remove the nuisance at the expense of the party on whose premises it exists, and sue him for such expenses. If any candle-house, melting-house, soap-house, slaughter-house, or place for boiling offal, blood, bones, etc., be certified by the medical officer, or any two medical practitioners, to be a nuisance, or injurious to the health of the inhabitants of the neighborhood, the local board may cause the person carrying on such trade to appear before a justice of the peace, and if it is not satisfactorily proved that he does not use the best practicable means for preventing or counteracting the effluvia, he is fined. So if houses are overcrowded, this may be stopped. Provisions are also enacted with a view to prevent the spread of diseases in times of epidemics, and to prevent common lodging-houses being kept in a foul state. Another important provision relates to the seizure of diseased meat and provisions exposed to sale, and the medical officer of health, or inspector of nuisances, has at all times power to inspect any animal, carcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, or flour; and if found unfit for food, or diseased, or unsound, they may be carried away then and there and destroyed, and the shopkeeper fined. The local authority may also order owners of houses to supply proper water-closets, and to cleanse gutters and cess-pools which are foul. Besides the above provisions as to nuisances generally, there are separate statutes for the English metropolis and the river Thames; thus furnaces in mills, factories, bake-houses, etc., in London, must consume their own smoke. These statutes are the 16 and 17 Vict. c. 128, and 19 and 20 Vict. c. 107. The public health act, 1875 (39 and 40 Vict. c. 55), practically codifies the law on all such matters. The rivers pollution act, 1876 (39 and 40 Vict. c. 75), deals with another important species of nuisance.

In Scotland, a nuisances removal statute was passed in 1856, and was re-enacted by the public health act, 1867, 30 and 31 Vict. c. 101. By that act the town council, or police commissioners of the place, are constituted the local authority for enforcing the act, and in other places the parochial board. Besides dealing with the same class of nuisances as the English act, the Scotch act provided for checking all trades and businesses offensive and injurious to the health of the neighborhood. Similar powers were given to the local board to enter private houses and explore the causes of nuisances. Diseased and unwholesome meat and provisions may also be seized. Common lodging-houses were to be registered, and to be subject to rules and regulations to be made by the local authority. With regard to towns in Scotland, an extensive code of police laws was enacted in the general police and improvement acts, 25 and 26 Vict. c. 101, 31 and 32 Vict. c. 102. The acts may be adopted by burghs; and villages above 700 of popula-

tion may, by vote of householders, be converted into burghs for this purpose. A smoke nuisance act for Scotland was passed applicable to all burghs, 20 and 21 Vict. c. 73; 24 Vict. c. 17; 28 and 29 Vict. c. 102.

The above is the usual legal acceptation of the term nuisance, but the word is sometimes used popularly to denote that class of nuisances, caused by disorderly houses or brothels, which are familiarly described as common nuisances. In the law of England those who keep a brothel are liable to be indicted for a misdemeanor, but as there was often a difficulty in setting the law in motion in such cases, a statute of 25 Geo. II. c. 36, enacted that if any two inhabitants should give notice to a constable of such a house being kept, it should then be the duty of the constable under a penalty, to go with such inhabitants before a justice and engage to prosecute the keeper, and their expenses are paid by the parish out of the poor-rates. The same act provided that whoever in point of fact acted as the master or the mistress of the house, should be taken to be the keeper of the house. The punishment is fine and imprisonment. Of late an attempt has been made to convict a landlord under this statute when he knows of the character of his tenants, and refuses to give them notice to quit; but the courts have held that the mere fact of the landlord refusing to give notice to quit, and so to eject such tenants, was not enough to make him liable in any criminal punishment. In Scotland, the offense of keeping a brothel is punishable in a similar manner. But apart from the keeping of a brothel, there is no criminal offense committed in this country by those who frequent such houses for the purposes of prostitution unless where the circumstances amount to rape (q.v.), or abduction (q.v.), or an aggravated assault. See *Supp.*, page 892.

NULLA BONA, a legal phrase in England, descriptive of the return made to a sheriff, who in executing process against a debtor finds he has no goods.

NULLIFICATION, in American politics, the doctrine of the extreme states' rights party, of the right of a state to declare a law of congress unconstitutional and void, and if the federal government attempted to enforce it to withdraw from the union. In 1832, during the presidency of gen. Jackson (q.v.), the free trade and states' rights party in South Carolina (q.v.), under the leadership of John C. Calhoun (q.v.), her senator in congress, asserted the doctrine of nullification in a state convention which declared the tariff acts of that year unconstitutional, and therefore null and void; that the duties should not be paid; and that any attempt on the part of the general government to enforce their payment would cause the withdrawal of South Carolina from the union, and the establishment of an independent government. President Jackson met this declaration with a vigorous proclamation, in which he declared that the laws must be executed, and that "the union must and shall be preserved." South Carolina, standing alone, receded from her position under protest, and a "compromise bill," introduced by Henry Clay (q.v.) in 1833, providing for a gradual reduction of duties, for the time settled the controversy.

NULLIFICATION (*ante*), in general, might be used to indicate any act of absolute invalidation or making void, but is almost exclusively applied to the doctrine first set forth by John C. Calhoun in a paper known as the *South Carolina Exposition*, which was presented by him in 1828 to the legislature of that state, and by them ordered printed. This doctrine asserted the right of any state to declare the unconstitutionality of any United States law, though it should have been passed in the proper manner, have received the assent of the president, and even have been tested as to its constitutionality before the U.S. supreme court. And it was further claimed that any attempt to enforce such law in a state which had refused to acknowledge its force was such an unconstitutional violation of the sovereign rights of that state as would justify her in at once leaving the union. The immediate cause of this remarkable assertion of power was the existing system of tariff laws, which, it was claimed, bore with great unfairness on the non-manufacturing and raw-material-producing southern states. The argument was in great measure based on language used by Jefferson in drawing up the Kentucky and Virginia resolutions of 1798–99 in regard to the sedition and alien laws. Here it was asserted that the general government was not "the final or exclusive judge of the extent of the powers delegated to itself, but that, as in all other cases of compact among powers having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress." These resolutions further express the conviction that other states "returning to their natural rights in cases not made federal, will concur in declaring such laws void and of no force, and will each take measures of its own in providing that neither these acts nor any others of the general government not plainly and intentionally authorized by the constitution, shall be exercised within their respective territories." Senator Hayne of South Carolina was the first to advocate openly the destructive doctrine based on these expressions of Jefferson, and his speech on the subject in the senate called forth Webster's famous oration of Jan. 26, 1830. The theory rapidly gained ground among the extreme believers in state sovereignty, and toward the close of 1832 the governor of South Carolina, acting on the advice of Calhoun, summoned a convention to meet at Charleston. This convention reported for the action of the legislature an ordnance, declaring that the existing tariff law was "null and void, and no law," authorizing the citizens of the state to refuse payment of any taxes under that law after Feb. 1, 1832, and denying the right of the U. S. supreme court to pass upon the validity of the ordinance itself. This bold declaration of inde-

pendence from the authority of the general government was accompanied by the threat that if any steps were taken to enforce the collection of duties, the state would be justified in retiring from the union, and not a vote was cast against it in the convention. When congress met in 1832, Hayne was governor of South Carolina. Calhoun entered the senate, and the state legislature was on the point of enacting laws to carry out the nullification ordinance. The danger was averted partly by the adoption of the so-called Clay's compromise, a modification of the tariff law, but chiefly by the firm and wise action of Andrew Jackson, then serving his second term as president. His orders to the revenue officers of Charleston showed his intention to carry out the laws and maintain the authority of the general government; it was well known that he was not a man to be trifled with or intimidated, and his special message to congress on the subject is one of the ablest state-papers produced in the country's history. The authorship of the proclamation is generally attributed to Edward Livingston, the secretary of state. Jackson's position as a southern democrat and as a military hero also had much weight. Calhoun made an able and ingenious speech in the senate, Feb., 1833, sustaining his view of nullification, but the movement had lost its force, and though there was for some years a party of nullifiers under Calhoun's leadership, that form of the doctrine of state sovereignty was no longer a factor in politics, though undoubtedly the forerunner and logical parent of the doctrine of the right of secession.

NU'MA POMPIL'IUS, in the mythic history of Rome, was the successor of Romulus, the founder of the city. He was a native of Cures in the Sabine country, and was universally reverenced for his wisdom and piety. Unanimously elected king by the Roman people, he soon justified by his conduct the wisdom of their choice. After dividing the lands which Romulus had conquered, he proceeded, with the assistance of the sacred nymph Egeria, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for 39 years, and was a golden age of peace and happiness. The only feature in the myth of Numa Pompilius which we can regard as probably historical, is that which indicates the infusion of a Sabine religious element into Roman history at some remote period.

NUMANTIA, the chief t. of the Celtiberian people called Arevaci in ancient Spain, was situated on the Douro (Durius), in the neighborhood of the present Soria in old Castile. The site is probably marked by the present Puente de Guarray. Numantia is celebrated for the heroic resistance which it made to the Romans, from 153 B.C., when its citizens first met a Roman army in battle, to 134 B.C., when it was taken and destroyed by Scipio the younger, after a siege of 15 months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders. The besieging force under Scipio amounted to 60,000 men.

NUMBERS, THEORY OF, the most subtle and intricate, and at the same time one of the most extensive, branches of mathematical analysis. It treats primarily of the forms of numbers, and of the properties at once deducible from these forms; but its principal field is the theory of equations, in as far as equations are soluble in whole numbers or rational fractions, and more particularly that branch known as indeterminate equations. Closely allied to this branch are those problems which are usually grouped under the diophantine analysis (q.v.), a class of problems alike interesting and difficult; and of which the following are examples: 1. *Find the numbers the sum of whose squares shall be a square number;* a condition satisfied by 5 and 12, 8 and 15, 9 and 40, etc. 2. *Find three square numbers in arithmetical progression;* Answer, 1, 25, and 49; 4, 100, 196, etc.

Forms of numbers are certain algebraic formulas, which, by assigning to the letters successive numerical values from 0 upwards, are capable of producing all numbers without exception, e.g., by giving to m the successive values 0, 1, 2, 3, etc., in any of the following groups of formulas: $2m$, $2m + 1$; $3m$, $3m + 1$, $3m + 2$; $4m$, $4m + 1$, $4m + 2$, $4m + 3$, we can produce the natural series of numbers. These formulas are based on the self-evident principle, that the remainder after division is less than the divisor, and that, consequently, every number can be represented in the form of the product of two factors + a number less than the smaller factor.

By means of these formulas, many properties of numbers can be demonstrated without difficulty. To give a few examples. (1.) *The product of two consecutive numbers is divisible by* 2: Let $2m$ be one number, then the other is either $2m + 1$ or $2m - 1$, and the product $2m(2m \pm 1)$ contains 2 as a factor, and is thus divisible by 2. (2.) *The product of three consecutive numbers is divisible by* 6: Let $3m$ be one of the numbers (as in every triad of consecutive numbers one must be a multiple of 3), then the others are either $3m - 2$, $3m - 1$; $3m - 1$, $3m + 1$; or $3m + 1$, $3m + 2$. In the first and third cases, the proposition is manifest, as $(3m - 2)(3m - 1)$, and $(3m + 1)(3m + 2)$, are each divisible by 2, and therefore their product into $3m$ is divisible by 6 (= 1.2.3). In the second case the product is $3m(3m - 1)(3m + 1)$, or $3m(9m^2 - 1)$, where 3 is a factor, and it is necessary to show that $m(9m^2 - 1)$ is divisible by 2; if m be even, the thing is proved; but if odd, then m^2 is odd, $9m^2$ is odd, and $9m^2 - 1$ is even; hence, in this case also the proposition is true. It can similarly be proved that the product of four consecutive numbers is divisible by 24 (= 1.2.3.4), of five consecutive numbers by 120 (= 1.2.3.4.5), and so on generally. These propositions form the basis for proof of many properties of numbers, such as that the difference of the squares of any two odd numbers is

divisible by 8. The difference between a number and its cube is the product of three consecutive numbers, and is consequently (see above) always divisible by 6. Any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers: thus, $41 = 25 + 16 = 5^2 + 4^2$, $233 = 169 + 64 = 13^2 + 8^2$, etc.

Besides these, there are a great many interesting properties of numbers which defy classification; such as, that the sum of the odd numbers beginning with unity is a square number (the square of the number of terms added), i.e., $1 + 3 + 5 = 9 = 3^2$, $1 + 3 + 5 + 7 + 9 = 25 = 5^2$, etc.; and, the sum of the cubes of the natural numbers is the square of the sum of the numbers, i.e., $1^3 + 2^3 + 3^3 = 1 + 8 + 27 = 36 = (1 + 2 + 3)^2$, $1^3 + 2^3 + 3^3 \times 4^3 = 100 = (1 + 2 + 3 + 4)^2$, etc.

We shall close this article with a few general remarks on numbers themselves. Numbers are divided into *prime* and *composite*—prime numbers being those which contain no factor greater than unity; composite numbers those which are the product of two (not reckoning unity) or more factors. The number of primes is unlimited, and so consequently are the others. The product of any number of consecutive numbers is even, as also are the squares of all even numbers; while the product of two odd numbers, or the squares of odd numbers, are odd. Every composite number can be put under the form of a product of powers of numbers; thus, $144 = 2^4 \times 3^2$, or, generally, $n = a^p.b^q.c^r$, where a, b, and c are prime numbers, and the number of the divisors of such a composite number is equal to the product $(p + 1)(q + 1)(r + 1)$, unity and the number itself being included. In the case of 144, the number of divisors would be $(4 + 1)(2 + 1)$, or 5×3, or 15, which we find by trial to be the case. *Perfect numbers* are those which are equal to the sum of their divisors (the number itself being of course excepted); thus, $6 = 1 + 2 + 3$, $28 = 1 + 2 + 4 + 7 + 14$, and 496, are perfect numbers. *Amicable numbers* are pairs of numbers, either one of the pair being equal to the sum of the divisors of the other; thus, 220 (= 1+ 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110 = 284), and 284 (= 1 + 2 + 4 + 71 + 142 = 220), are amicable numbers. For other series of numbers see FIGURATE NUMBERS.

The most ancient writer on the theory of numbers was Diophantus, who flourished in the 3d c., and the subject received no further development till the time of Vieta and Fermat (the latter being the author of several celebrated theorems, a discussion of which, however, is quite unsuited to this work), who greatly extended it. Euler next added his quota, and was followed by Lagrange, Legendre, and Gauss, who in turn successfully applied themselves to the study of numbers, and brought the theory to its present state. Cauchy, Libri, and Gill (in America) have also devoted themselves to it with success. The chief authorities down to the present century are Barlow's *Theory of Numbers* (1811); Legendre's *Essai sur la Théorie des Nombres* (3d ed., Paris, 1830); and Gauss's *Disquisitiones Arithmeticæ* (Brunswick, 1801; Fr. translation, 1807); and for the latest discoveries, the transactions of the various learned societies may be consulted.

NUMBERS, BOOK OF (LXX. *Arithmoi;* Heb. *Bamidbar*), the fourth book of the Pentateuch, consists of 36 chapters, embracing the history of the march of the Israelites through the desert, together with the special laws given during this period as complementary to the Sinaitic legislation. Beginning with the census of the people (whence the name of the book), and the assigning of the special places to each tribe with reference to the sanctuary, the whole people is classified, and the tribe of Levi specially singled out. Ordinances on the purity to be maintained in the camp, the functions of the priests, and a description of the passover, follow. The second portion of the book describes the journey from Sinai to the borders of Canaan, the miraculous sustenance of the people, their dissatisfaction and consequent rejection, together with various special laws respecting sacrifices, etc., and the episode of Korah. The third part embraces the first ten months of the fortieth year of the wandering—an epoch hurried over with remarkable swiftness by the historian. In quick succession, the renewed strife of the people with their leaders, the message to the king of Moab, the death of Aaron, the defeat of the king of Arad, the punishment of the people by serpents, the march from Hor to Pisga, and the victorious battle against the kings of Sihon and Og, are recounted, and the extraordinary episode of Balaam follows. The further wiles employed by the alarmed Moabites and Midianites to avert the threatening invasion, and their result, together with the second census, are narrated. Moses is warned of his death, and the vital question of his succession is settled. Further laws and ordinances respecting sacrifices and vows, the conquest of the Midianites, and the partition of the country east of the Jordan among certain tribes, a recapitulation of the encampments in the desert, a detailed specification of the manner in which the promised land should be divided after its conquest, and the final ordinance of the marriages of heiresses among their own tribe only, so as to preserve the integrity of landed property, make up the remainder of the book.

The book of Numbers is, like the rest of the Pentateuch, supposed by the greater part of modern critics to consist of several documents written by *Elohists* and *Jehovists* respectively. See GENESIS, PENTATEUCH.

NU'MERALS, the general name given to figures or symbols by means of which numbers are expressed (for Roman and Greek numerals, see NOTATION); the distinctive name of *Arabic numerals* being given to the nine figures or digits and the zero that are now

in almost universal use among civilized nations for this purpose. Both the origin of these figures and the period at which they became known in Europe have been made subjects of laborious investigation; and it seems to be now proved beyond a doubt that they are of Indian, not Arabic, origin, and were invented by the Brahmans some time B.C. But the more important inquiry as to the time of their introduction into Europe has hitherto baffled all research. The simple and convenient theory that they were introduced into Spain by the conquering Arabs, and from that country, then a great seat of learning, a knowledge of them was disseminated throughout Europe, is contradicted by the fact that the eastern Arabs themselves had no knowledge of them previous to the time of the caliph Al-Mamun (813–33), while a knowledge of them existed in Europe from a considerably earlier date. The most probable theory is that they were brought from India, probably by the Neo-Pythagoreans, and introduced into Italy, whence they became known to a few of the learned men of eastern Europe. We have, however, every reason to suppose that the figures then known were totally different in form from those now used. These latter, called *gobar* by the Arabs, may have been brought to Bagdad during the reign of Al-Mansor (760), or his immediate successors, and certainly not later than the time of Al-Mamun. During the latter reign we know the present system of arithmetic was introduced into Persia from India, and most probably a knowledge of the gobar figures at the same time. Thence the system of arithmetic was brought to north-western Africa and Spain, and doubtless the figures along with it, about the end of the 10th or beginning of the 11th c., and from Spain a knowledge of both was speedily communicated to the rest of Europe, the gobar figures superseding those forms of eastern figures which had previously been employed. The knowledge of the figures, however, spread, as was natural, much more rapidly than the notation and arithmetic of which they were the foundation, and we consequently find in writings and inscriptions of the middle ages the gobar figures partly substituted for, and mixed up with, the Roman numerals; as, for instance, XXX2, for 32; X4, for 14, etc.; and occasionally such expressions as 302, 303, for 32 and 33. The earliest work on modern arithmetic was published in Germany in 1390; it explained the decimal notation and exemplified the elementary rules. The Arabic numerals were not generally introduced into England till the commencement of the 17th c., and it was long after that time before the decimal arithmetic became general. See a dissertation *Sur les Chiffres Indiens*, by M. Woepke, in the Asiatic journal; also, Taylor's *The Alphabet* (1883).

NUMERALS (*ante*). The only valuable essays on the introduction of our present numerals are the works of Woepeke, in the *Encyclopædia Metropolitana*, London, 1845, vol. i., p. 412; in the *Journal Asiatique*, 6th series, vol. i., 1863, pp. 27, 234, 442; and his monograph, *Sur l'Introduction de l'Arithmetique Indien en Occident*, Rome, 1859. His knowledge of Sanskrit, Arabic, and the higher mathematics, may be seen in his reconstruction of that passage where the education of the infant Buddha is exemplified by a kind of competition-wallah, on the basis of the logical figure of the "heap." But we are only just beginning to get reliable dates in Indian archæology, and the edition of Prinsep by Thomas, 1863, the archæological part of the surveys of India, the labors of German scholars in the line of Shemitic influence on early Indian alphabets, all point to conclusions at variance with those of the scholars of the last generation. There are three sets of figures in use among what may be called the mathematical nations, the Sanskrit (this name is used because it does not identify them with any particular alphabet), the Neskhi (as used with the present Arabic alphabet), and the European. None are now as they were in the year 1000 A.D., and none is an immediate borrowing from another. All seem to have been once used without notational place, that is, without the zero, Arab-Greek *τζιφρα*, Sansk. suneja, both meaning *void*. The earliest Sanskrit figures appear to be of A.D. 674. Bactrian numerals are used till B.C. 116, they are Shemitic, and without notation. The Pali numerals which accompany the series of inscriptions from the 3d c. B.C. to the 5th c. A.D., are partly tallies, partly alphabetic, partly Shemitic, and are also without notation. The Sanskrit figures must be traced back through a Devanagari 10th c. type, through a still older Kashmir shape, to identifiable initials of their Pali (?) names in characters which are not quite identical with either Pali, Allahabad, or Sindh-multani. The resemblance of 1, 2, 3 to our own figures vanishes as we go back, and the only shadow of likeness is an accidental form of the old 7. Evidently, there remains at that point not the slightest resemblance to any modern Devanagari letters, nor are the letters those usually proposed, as the six is spelled with chh, and seven with t. The other two types are, as to a few of their figures, bound together by a common origin, though dissimilar in shape and derivation. It may be well to remind the reader that Alexandria, with the party-colored nationalities who traded there, serves as a great receptacle, not only of all the mysticism but of all the knowledge of the antique east. What a jumble of perverted intelligence remained long after any practical instruction had vanished may be easily seen by studying any of the patristic compilations, or any of the early Arabic encyclopædists. The Arabs of n. Egypt and Barbary, Mughrabin, had always certain heretical traditions, a different arrangement of the supplementary letters of the alphabet, and certain differences in the figures, which distinguished them from their fellows of the east. Their civilization seems earlier and more practical. The oldest figures known (except Chinese current marks) are the Egyptian, and they go

I· II· III· IIII·, which in Demotic are changed to one long stroke, with the others reduced each to a short scrabble on its upper left side. The Hieratic changes the tallies to a series of vertical scrabbles, and from these come the Demotic signs for months, 1, 2, 3, almost identical with our figures. These furnish the radical distinction between Arabic and Gobar figures. The Arabic, at least the Neskhi, takes the first four Demotic figures, and, necessarily reversing them in its writing from right to left, adds to them others, of which only 9 bears a chance resemblance to an European figure. The Gobar takes the three Demotic month figures, adds the Demotic common 4, and the rest are identical with the old Mughrab, with the apices of Boethius, and with our modern figures. Variant types are old Arabic 4 like a Greek sigma, Σ, and 5 like our 8 with a tail; the Gobar and the Boethian signs have another 2, like a Saxon t; the 14th c. European 4 is like a Greek lambda, *Λ*. The apices, occurring in an old manuscript of Boethius, but unfortunately not to be fixed in date, have every appearance of being Gnostic. The signs are strangely deformed, and their names, affixed, are from 4 to 9, Syrian, but 1 and 2 are Indo-German, and 3 unreadable. As the Gobar seem older than the Neskhi, and as their first four figures are undoubtedly Egyptian, it may be that the rest, our figures of to-day, are also debased Demotic. They would be either alphabetical—but of the sequence of the Demotic alphabet we are not entirely certain—or initial—but, if so, of Coptic numbers, or of Arabic numbers spelled in Coptic? It seems impossible to tell, and no guessing, or discovery of chance relation in appearance, is of the slightest value. A series of deductions would attribute the other Neskhi figures to either a Syriac alphabet becoming Kufic, or perhaps to some arrangement of Perso-Bactrian signs with which we are not yet acquainted. The manuscript of Washiyi will show with how many signs an inquisitive Arab of his time might be familiar, while without real knowledge of a single alphabet, even, beside his own.

NUMERATION, the reading off of numbers that are expressed by figures. As shown in notation (q.v.), the first figure on the right hand expresses units; the next, tens; the third, hundreds; and following the same nomenclature with the next three figures, we have the fourth expressing units of thousands; the fifth, tens of thousands; the sixth, hundreds of thousands. The seventh figure, in like manner, expresses units of millions; the eighth, tens of millions; and the ninth, hundreds of millions. When this method is consistently followed out, as is the case with French and other continental arithmeticians, the fourth period, or group of three figures, is denominated billions, the first figure of it (the tenth from the extreme right) being units of billions; the next, tens of billions; etc. Read in this way, the figures 56,084,763,204,504 express fifty-six trillions, eighty-four billions, seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. In Britain there is a slight variation in the mode, the only effect of which is to render it a little more complicated; thus, after units of millions, come tens and hundreds of millions, but then instead of billions we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which occupy the 13th figure from the right, and are reckoned in the same way as millions, so that the next unit or *trillions* does not come in till the 19th figure. The above number, according to the British mode, would be read fifty-six billions, eighty-four-thousand-seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and four units. The first method is perfectly symmetrical, keeping throughout to divisions of three figures; the second only keeps to this division up to hundreds of millions, when it changes it for a division into parcels of six figures, which are named from units up to hundreds of thousands of units. The latter mode is, however, gradually falling into disuse.

NUMIDA. See GUINEA FOWL, *ante*.

NUMID'IA (Gr. *Nomadia*, the land of Nomads), the name given by the Romans to a part of the n. coast of Africa, corresponding to some extent with the modern Algiers. It was bounded on the w. by the river Mulucha (now *Moluya*), which separated it from Mauritania; on the e. by the river Tusca (now *Wadi-el-Berber*), which separated it from the territory of Carthage, the *Africa Propria* of the Romans; on the s. it reached to the chains of mt. Atlas and the Lacus Tritonis, which separated it from the land of the Gaetulians and interior Libya. The chief rivers were the Rubricatus and the Ampsaga. The inhabitants of Numidia, as of Mauritania, belonged to the race from which the modern Berber are descended. They were a warlike race, and excelled as horsemen; but, like most barbarians, were faithless and unscrupulous. Of their tribes, the *Massyli* in the e., and the *Massæsyli* in the w., were the most powerful. In the grand struggle between the Carthaginians and the Romans, they at first fought on the side of the former, but subsequently the king of the eastern Numidians, Massinissa, joined the Romans, and rendered them effectual service in the war with Hannibal. Favored by the conquerors he united all Numidia under his sway. Of his successors in this kingdom Jugurtha and Juba are the most famous. After the victory of Cæsar over Juba I., in the African war, Numidia became a Roman province (46 B.C.); but Augustus afterwards gave the western part—from the river Ampsaga, now Wadi-el-Kibbir—with Mauritania, to Juba II., and the name Numidia became limited to the eastern part; and when Mauritania became a Roman province, the western part was called Mauritania Cæsariensis.

Among the Roman *coloniæ* were Hippo Regius, near the mouth of the river Rubricatus; Cirta (the residence of the Numidian kings), afterwards called Constantina, a name still preserved in Constantine; Sicca, and Rusicada. For the modern history of Numidia see ALGIERS.

NUMISMATICS (Lat. *nummus* and *numisma*, money; Gr. *nomisma*, from *nomos*, law, a medium of exchange established by law), the science which treats of coins and medals. A coin is a piece of metal of a fixed weight stamped by authority of government, and employed as a circulating medium. A medal is a piece struck to commemorate an event. The study of numismatics has an important bearing on history. Coins have been the means of ascertaining the names of forgotten countries and cities, their position, their chronology, the succession of their kings, their usages—civil, military, and religious—and the style of their art. On their respective coins we can look on undoubtedly accurate representations of Mithridates, Julius Cæsar, Augustus, Nero, Caracalla, and read their character and features.

The metals which have generaliy been used for coinage are gold, silver, and copper. In each class is comprised the alloy occasionally substituted for it, as electrum (an alloy of gold and silver) for gold, billon for silver, bronze for copper, and potin (an alloy softer than billon) for silver and copper. The side of a coin which bears the most important device or inscription is called the *obverse*, the other side the *reverse*. The words or letters on a coin are called its inscription; an inscription surrounding the border is called the *legend*. When the lower part of the reverse is distinctly separated from the main device, it is called the *exergue* (Gr. *ex ergou*, without the work), and often bears a secondary inscription, with the date or place of mintage. The field is the space on the surface of the coin unoccupied by the principal device or inscription.

The use of coined money cannot be traced further back than the 9th c. B.C. Money, however, as a medium of exchange, existed much earlier, and when of metal it passed by weight, no piece being adjusted to any precise weight, and all money being weighed when exchanged. Early metallic money was in the form of bars, spikes, and rings; the ring money could be opened, closed, and linked in a chain for convenience of carriage.

The Lydians are supposed to have been the first people who used coined money, about 700 or 800 years before the Christian era; and their example was soon after followed by the different states of Greece, the earliest Greek coins being those of Ægina. In its early stages the process of coining consisted in placing a lump of metal of a fixed weight, and approaching to a globular form, over a die, on which was engraved the religious or national symbol to be impressed. A wedge or punch placed at the back of the metal was held steadily with one hand, and struck by a hammer with the other, till the metal was sufficiently fixed in the die to receive a good impression. The impression was a guarantee of the weight of the piece. From the nature of the process, the earliest coins had a lumpish appearance, and on their reverse was a rough, irregular, hollow square, corresponding to a similar square on the punch, devised for the purpose of keeping the coin steady when struck by the coining hammer. The original coins of Asia Minor were of gold, those of Greece of silver. The earliest coins bear emblems of a sacred character, often embodying some legend regarding the foundation of the state, as the *phoca* or seal on the coins of the Phocians, which alludes to the shoal of seals said to have followed the fleet during the emigration of the people. A very early double stater of Miletus, in Ionia, of which the type is the lion's head, was derived from Persia and Assyria, and associated with the worship of Cybele, a symbol which is continued in the later coinage of Miletus. Types of this kind were succeeded by portraits of protecting deities. The earliest coins of Athens have the owl, as type of the goddess Athene; at a later period, the head of the goddess herself takes its place, the owl afterwards re-appearing on the reverse. The punch-mark, at first a rudely-roughed square, soon assumed the more sightly form of deep, wedge-like indents, which in later specimens become more regular, till they form themselves into tolerably symmetrical square. In the next stage, the indents become shallower, and consist of four squares forming one large one. The surrounding of the punch-mark with a band bearing a name, and the introduction of a head in the center, gradually led to the perfect reverse. There is a remarkable series of so-called "encased" coins struck in Magna Græcia, of which the reverse is an exact repetition in concave of the relief of the obverse. These coins are thin, flat, sharp in relief, and beautifully executed.

The leading coin of Greece and the Greek colonies was the stater, so called because founded on a standard of weight generally received before the introduction of coined money. There were double staters, and half, third, and quarter staters, and the stater was equivalent in value to six of the silver pieces called drachmæ. The obolus was one-sixth of the drachma, at first struck in silver, in later times in copper.

The inscriptions on the earliest Greek coins consist of a single letter, the initial of the city where they were struck. The remaining letters, or a portion of them, were afterwards added, the name, when in full, being in the genitive case. Monograms sometimes occur in addition to the name, or part name, of the place. The first coin bearing the name of a king is the tetradrachm (or piece of four drachmæ) of Alexander I., of Macedon.

Among the early coins of Asia, one of the most celebrated is the stater Daricus or Daric, named from Darius Hystaspes. It had for symbol an archer kneeling on one

knee, and seems to have been coined for the Greek colonies of Asia by their Persian conquerors. In the reign of Philip of Macedon the coinage of Greece had attained its full development, having a perfect reverse. One of the earliest specimens of the complete coin is a beautiful medal struck at Syracuse, with the head of Proserpine accompanied by dolphins, and for reverse a victor in the Olympic games in a chariot receiving a wreath from victory—a type which is also found on the reverse of the staters of Philip of Macedon, known as Philips, and largely imitated by other states. Coins of Alexander the great are abundant, many having been struck after his conquests in the Greek towns of Asia. A rose distinguishes those struck at Rhodes, a bee those struck at Ephesus, etc.; these are all types generally accompanying the figure of Zeus on the reverse; on the obverse is the head of Hercules, which has sometimes been supposed to be that of Alexander himself. It would rather seem, however, that the conqueror's immediate successors were the first who placed their portrait on the coins, and that under a shallow pretence of deification, Lysimachus as a descendant of Bacchus, and Seleucus of Apollo, clothed in the attributes of these deities. Two most beautiful and important series of Greek coins are those of the Seleucidæ, in Asia, of silver, and of the Lagidæ or Ptolemies, in Egypt, of gold.

In Palestine there is an interesting series of coins founded on the religious history of the Jewish nation, and assigned to Simon Maccabæus. They are shekels and half-shekels, equivalent to two attic drachmæ and one drachma respectively. The shekels bear on the obverse the pot of manna, with the inscription "Schekel Israel" (the Shekel of Israel); on the reverse is Aaron's rod with three flowers, and the legend "Ierouschalim kedoschah" (Jerusalem the holy). The inscriptions are in the Samaritan character. The successors of Simon assumed the title of king, and placed their portraits on the coins, with inscriptions in Greek as well as in Hebrew.

Roman coins belong to three different series, known as the republican, the family, and the imperial.

The so-called republican, the earliest coinage, began at an early period of Roman history, and subsisted till about 80 B.C. Its standard metal was copper, or rather *æs* or bronze, an alloy of copper. The standard unit was the pound weight divided into twelve ounces. The *æs*, *as*, or pound of bronze, is said to have received a state impress as early as the reign of Servius Tullius, 578 B.C. This gigantic piece was oblong like a brick, and stamped with the representation of an ox or sheep, whence the word *pecunia*, from *pecus*, cattle. The full pound of the as was gradually reduced, always retaining the twelve (nominally) uncial subdivisions, till its actual weight came to be no more than a quarter of an ounce. About the time when the as had diminished to nine ounces, the square form was exchanged for the circular. This large copper coin, called the "as grave," was not struck with the punch, but cast, and exhibited on the obverse the Janus bifrons; and on the reverse, the prow of a ship, with the numeral I. Of the fractions of the as, the sextans, or the sixth part, generally bears the head of Mercury, and the uncia, or ounce piece, that of Minerva; these pieces being further distinguished by dots or knobs, one for each ounce. There were circular pieces as high as the decussis, or piece of twelve asses, presenting a head of Roma (or Minerva), but none are known to have been coined till the weight of the as had diminished to four ounces. The Roman uncial coinage extended to the other states of Italy, where a variety of types were introduced, including mythological heads and animals. In the reign of Augustus, the as was virtually superseded by the sestertius, called by numismatists the first bronze, about the size of our penny, which was at first of the value of two and a half, afterwards four asses. The sestertius derived its value from the silver denarius, of which it was the fourth. The half of the sestertius was the dupondius (known as the second bronze), and the half of the dupondius was called the assarium, an old name of the as. The assarium is known to numismatists as the third bronze.

Silver was first coined at Rome about 281 B.C., the standard being founded on the Greek drachma, then equivalent in value to ten asses; the new coin was therefore called a denarius, or piece of ten asses. The earliest silver coined at Rome has on the obverse the head of Roma (differing from Minerva by having wings attached to the helmet); on the reverse is a quadriga or biga, or the Dioscuri. Among various other types which occur in the silver of the Italian towns subject to Rome are the horse's head, and galloping horse, both very beautiful. During the social war, the revolted states coined money independently of Rome, and used various devices to distinguish it as Italian and not Roman money.

The earliest gold coins seem to have been issued about 90 B.C., and consisted of the scrupulum, equivalent to 20 sestertii, and the double and treble scrupulum. These pieces bear the head of mars on the obverse, and on the reverse an eagle standing on a thunderbolt, with the inscription "Roma" on the exergue. The large early republican coins were cast, not struck.

The family coins begin about 170 B.C., and about 80 B.C. they entirely supercede the coins first described. Those families who successively held offices connected with the public mint acquired the right first to inscribe their names on the money, afterwards to introduce symbols of events in their own family history. These types gradually superseded the natural ones; the portrait of an ancestor followed; and then the portrait of a living citizen, Julius Cæsar.

Under the empire, the copper sestertius, which had displaced the as, continued the nonetary standard. A magnificent series exists of the first bronzes of the emperors from Augustus to Gallienus. While it was the privilege of the emperors to coin gold and silver, copper could only be coined *ex senatus consulto*, which from the time of Augustus was expressed on the coins by the letters S.C., or EX S.C. The obverse of the imperial coins bears the portraits of the successive emperors, sometimes of the empress or other members of the imperial family; and the reverse represents some event, military or social, of the emperor's reign, sometimes allegorized. The emperor's name and title are inscribed on the obverse, and sometimes partly continued on the reverse; the inscription on the reverse generally relates to the subject delineated; and towards the close of the 3d. c., the exergue of the reverse is occupied by the name of the town where the coin is struck. The coins of Augustus and those of Livia, Antonia, and Agrippina the Elder have much artistic merit. The workmanship of Nero's sestertii is very beautiful. The coins of Vespasian and Titus commemorate the conquest of Judea. The colosseum appears on a sestertius of Vespasian. The coins of Trajan are noted for their architectural types. Hadrian's coins commemorate his journeys. The coins and medals of Antonine, Marcus Aurelius, and the two Faustinæ are well executed; as are also those of Commodus, of whom a remarkable medallion relates to the conquest of Britain. There is a rapid falling off in design after the time of Commodus, and base silver comes extensively into use in the reign of Caracalla. Gallienus introduced the practice of coining money of copper washed with silver.

The colonial and provincial money of this period was very inferior to that coined in Rome In the coins of the provinces which had been formed out of the Greek empire, the obverse bears the emperor's head and the reverse generally the chief temple of the gods in the city of coinage; the inscriptions are in Greek. In the imperial coins of Alexandria appear such characteristic devices as the heads of Jupiter Ammon, Isis, and Canopus, the sphinx, the serpent, the lotus, and the wheat-ear. Colonial coins were at first distinguished by a team of oxen, afterwards by banners, the number of which indicated the number of legions from which the colony had been drawn.

After the time of Gallienus, the colonial money and the Greek imperial money, except that of Alexandria, ceased, and much of the Roman coinage was executed in the provinces, the name of the town of issue appearing on the exergue. Diocletian introduced a new piece of money, called the follis, which became the chief coin of the lower empire. The first bronze has disappeared after Gallienus, and the second disappears after Diocletian, the third bronze diminishing to $\frac{1}{20}$ of an ounce. With the establishment of Christianity under Constantine, a few Christian types are introduced. The third bronze of that emperor has the Labarum (q.v.), with the monogram IHS. Large medallions, called *contorniati*, encircled with a deep groove, belong to this period, and seem to have been prizes for distribution at the public games. Pagan types recur on the coins of Julian; and after his time the third bronze disappears.

The money of the Byzantine empire forms a link between the subject of ancient and that of modern coins. The portrait of the emperor on the obverse is, after the 10th c., supported by some protecting saint. The reverse has at first such types as Victory with a cross, afterwards a representation of the Saviour or the Virgin; in some instances, the Virgin supporting the walls of Constantinople. Latin is gradually superseded by Greek in the inscriptions, and wholly disappears by the time of Alexius I. The chief gold piece was the solidus or nomisma, which was long famed in commerce for its purity, and circulated largely in the west as well as the east of Europe.

Of the coins of the middle ages, the most important is the silver denier or penny, derived from the Latin denarius. Its half was the obole, first of silver, afterwards of billon. Coins of this description were issued in the German empire, France, England, and the Scandinavian states, and in many cases by ecclesiastical princes and feudal lords as well as sovereigns. The obverse of the regal coin of the early middle ages is generally the bust of the sovereign, and the reverse a Greek cross, accompanied by the royal name or title, and the place of mintage or the moneyer (see MINT). The arms of the country were introduced in the 12th c., in conjunction with the cross, and afterwards superseded it. In the 13th and 14th centuries, coins began to be issued by free imperial cities or corporations of towns; and there prevailed extensively throughout Germany and other parts of Europe a thin piece called a bracteate, in relief on one side, and hollow on the other, often not bearing a single letter, and rarely a full inscription. Down to the 14th c., the relief of the mediæval coins is very inconsiderable, the pieces thin, and the art poor.

Britain received the Roman money on its subjugation. Constantine seems to have had a mint in London, and the Roman currency continued to circulate for a time after the departure of the conquerors. The first independent coinage, however, shows hardly a trace of the influence of Rome; it consists of two small coins, called the skeatta and styca, the former of silver, the latter of copper. Both seem to belong solely to the Saxon kingdom of Northumbria; they are without inscriptions; a bird, a rude profile, and several unintelligible symbols appear on them, and their art is of the most debased kind. In the other kingdoms of the heptarchy silver pennies were coined, first intended to be $\frac{1}{240}$ of a pound weight; on the disappearance of skeattæ and stycæ, they form, with the occasional addition of half-pennies, the sole currency of England down to the

reign of Edward III. The pennies of the heptarchy bear the name of the king or of the moneyer; a cross sometimes appears after the introduction of Christianity, and in later times a rude head of the king or queen. The pennies of the Saxon and Danish sole monarchs of England have a somewhat similar character. Alfred's earlier coins have a grotesque-looking portrait, and on the reverse a monogram of London; in his later coins the head disappears, and a cross and circle take its place. A cross variously ornamented with three pellets in each angle continues to be the usual reverse of the Saxon, Norman, and Plantagenet coins. The coins of Edward III. are a great artistic advance on those that preceded them. The silver coinage of that king consisted not only of pennies, half-pennies, and farthings, but also of groats and half-groats. The obverse of the groat bears a conventional crowned head within a flowered circle of nine arches, the words "Dei Gratia" and the title "Rex Franciæ" appearing for the first time in the legend. The reverse has the motto "Posui Deum adjutorem meum," which continued on the coinage till the time of Edward V. But the great numismatic feature of Edward III.'s reign is the issue of gold nobles, worth six shillings and eightpence. The obverse of those beautiful coins represent the king in a ship, a sword in his right hand, in his left a shield with the quartered arms of France and England. The reverse is a rich cross flory within a circle of eight arches, and a lion under a crown in each angle of the cross, the legend being "Ihesus autem transiens per medium illorum ibat." Half and quarter nobles were also coined. The noble having increased in value, a coin called an angel, of the former value of a noble, was issued by Henry VI. and Edward IV. The obverse represented St. Michael transfixing a dragon, the reverse a ship, with a cross for the mast.

As we approach the period of the reformation, the coinage gradually becomes more ornate. The nobles coined by Edward IV., after the value of that coin had been fixed at 10 shillings, were called rials (a name derived from a French coin), and the double rial or sovereign was first coined by Henry VII. The obverse has the king on his throne with scepter and orb, and on the reverse, in the center of a heraldic full-blown rose, is a shield with the arms of France and England. The testoon, or shilling, valued at twelve pence, also first appeared in this reign, with the royal profile crowned on the obverse, and the royal arms quartered by the cross on the reverse. A great debasement of the coinage took place in the reign of Henry VIII. The reverse of the farthings of that monarch bears a portcullis, that of the shillings a rose surmounted by a crown, and of the sovereigns, the royal arms supported by a lion and dragon. A noble was coined with St. George and the dragon on the obverse, and on the reverse a ship with three crosses for masts, and a rose on the center mast. On the coins of Henry VIII. the title "Hiberniæ Rex" first appeared, former kings having only styled themselves "Dominus Hiberniæ," Ireland not being accounted a kingdom. Under Edward VI. the silver coins called crowns and half-crowns appear, having for device the king crowned on horseback in the armor of the period. They derived their name from coins circulating on the continent, which had for device a crown. The royal arms in an oval shield without the cross are introduced as the reverse of the shilling. From this period there is a very obvious decline in the artistic feeling of the English coins. On some of the shillings of Mary, her bust and that of Philip face each other, the insignia of Spain and England impaled occupying the reverse; afterwards the king's head occupies one side of the coin, and the queen's the other. Half sovereigns, or rials, and angels were coined of the old type of Edward IV. The great event in the coinage of Elizabeth's reign was the temporary introduction of the mill and screw, instead of the hammer and punch, producing coins of a more regular and workmanlike appearance. The profile bust of James I., crowned and in armor, appears on his shillings and smaller pieces; on his crowns and half-crowns he is represented on horseback; on the reverse are the quartered arms of the three kingdoms (the harp of Ireland appearing for the first time on the coinage), with the motto "Que Deus conjunxit nemo separet." Copper farthings, with crown, scepter, and sword on the obverse, and a harp on the reverse, were coined for England as well as Ireland, the first copper money issued in England since the styca. Private tokens of copper, issued by tradesmen and others, had, however, been in circulation before, and came again into use to a large extent at a later period. Charles I. coined ten and twenty shilling pieces of silver, the former a very noble coin, with a representation of the king on horseback. A crown, struck at Oxford, bears on the obverse the king on horseback, with a representation of the town, and on the reverse the heads of the Oxford declaration. The guinea, first coined in this reign, was so called from the metal being procured from the coast of Guinea; its original value was but twenty shillings.

The coins of the commonwealth exhibit a shield with the cross of St. George surrounded by a palm and olive branch, and have for legend "the commonwealth of England." On the reverse are two shields accollée, with the cross of St. George and the harp of Ireland, and the motto "God with us." Coins far superior in character were executed by Cromwell, with his laureated bust and title as protector, and on the reverse a crowned shield quartering the cross of St. George, of St. Andrew and the harp, with the protector's paternal arms in surtout; but few of these were issued. In the early coins of Charles II., that monarch is crowned, and in the dress of the time; in his later money he is in conventionalized Roman drapery, with the head turned to the left, and from that time it has been the practice to turn every king's head the reverse way from

that of his predecessor. The four shields on the reverse are disposed in the form of a cross (an arrangement which continued till the reign of George II.), and on the edge of the crowns and half-crowns is the legend "Decus et tutamen." Charles II. issued a copper coinage of half-pennies and farthings; on the former appears the device of Britannia, taken from the Roman coins relating to Britain. Pennies were not coined till George III.'s reign. The coins of William and Mary have the profiles of the king and queen one over the other, and the shields of the three kingdoms in the form of a cross on the reverse, with Nassau in the center. The coinage of William alone, after the death of Mary, is of somewhat improved design, sir Isaac Newton being then master of the mint. Little change in the general design of the coin occurs in the reigns of Anne and George I. On the accession of the house of Hanover, the Hanoverian arms are placed in the fourth shield, and George IV. substituted a quartered shield with Nassau en surtout for the four shields on the reverse of his gold coins. During the greater part of George III.'s reign the coinage was utterly neglected, and the silver pieces in circulation were worn perfectly smooth. When coins were at last issued, the Roman conventionalism of the previous reigns gave way to a now fashionable Greek conventionalism. The quartered shield supplanted the four shields, and on the reverse of the crown appeared a Grecianized St. George and the dragon. George IV.'s bust is taken from Chantrey's statue; the rose, thistle, and shamrock, united under a crown, appear on the reverse of his shilling. Silver groats were issued in the reign of William IV. The ensigns of Hanover disappeared at the beginning of the present reign; the reverse of the shilling is even poorer than that of George IV., the words "One shilling" occupy the field, surrounded by an oak branch and a laurel branch; silver pieces of three pence have been introduced. But the principal monetary event is the issue of the silver florin, in value equivalent to two shillings, looked on as a step towards the institution of a decimal coinage. It represents the head of the queen crowned, with the legend in old English character, and for reverse the four shields are once more placed in the form of a cross.

No native Scottish coinage existed earlier than the 11th century. Coins are extant of Somerled, prince of the Isles of that century, and of Alexander I. of the century following. The silver pennies of William the lion, and Alexander II. and III., are like contemporary English money, but ruder, and bear the names of the moneyers and place of mintage, generally Edinburgh, Perth, or Berwick. The profiles on the coins of John Baliol, Robert Bruce, and David II. are attempts at portraiture. A remarkable gold piece, first coined by Robert II., is the St. Andrew, with the arms of Scotland on the obverse, and St. Andrew on his cross on the reverse. In the four succeeding reigns the weight of the silver coins rapidly decreased, and coins of billon, or base metal, were issued, nominally pennies, but three and a half of which eventually passed for a silver penny. The evil increased, and baser and baser alloy was used. Groats of billon, known as placks and half-placks, were coined by James III. James IV.'s coins have a characteristic portrait, and a good deal of artistic feeling. James III. and IV. issued well executed gold pieces, called unicorns and riders, the type of the one being the unicorn, of the other the king on horseback. A still more beautiful coin was the gold bonnet piece of James V., so called from the cap in the king's portrait. Of Mary there are a great variety of interesting pieces. The portrait is sometimes crowned, sometimes uncrowned; and on the coin issued soon after Francis's death, has a widow's cap and high-frilled dress. The types in James VI.'s reign are also very various. On his accession to the English throne, the relative value of English and Scottish coins was declared to be as 12 to 1. The coins afterwards issued from the Scottish mint differed from the English, chiefly in having Scotland in the first quarter in the royal shield. The last Scottish gold coinage consisted of pistoles and half-pistoles of Darien gold, about the size of a guinea and half-guinea, struck by William III.; the pistole distinguished by a rising sun under the bust of the king.

The coinage of Ireland is scanty and uninteresting compared with that of Scotland. The coins of English monarchs struck in Dublin resemble much those current in England. Henry VIII. first placed a harp on the Irish coins.

In France, the earliest coins are those of the Merovingian kings, rude imitations of the late Roman and early Byzantine money, and mostly of gold. Under the Carlovingian dynasty, deniers and oboles are the prevailing coinage, remarkably rude in fabric without portrait, and bearing the name of the king and place of mintage. Some coins of Charlemagne, struck at Rome, are of better workmanship. They contain one letter of "Roma" at each extremity of the cross, with the legend "Carolus IP." The coinage improved under the Capetian kings; the fleur-de-lis appears in addition to the cross. In the 13th c. gold pieces were issued, and in the time of Philip VI. both the design and the execution of the coins are beautiful. The coins of Louis XII. are the first that bear the royal portrait. The modern coinage may be said to begin under Henry II., whose portrait is good. The seignorial coins of France in the middle ages are of considerable importance, and the medals of Louis XIV. and Napoleon I. are much more interesting than the modern coins.

The mediæval coinage of Italy is of great interest. The money of the Lombard kings of Italy and dukes of Benevento, is little inferior to that of the Greek emperors. There is a beautiful series of gold and silver pieces belonging to Venice, bearing the names of

the doges, and having generally for type the doge receiving the gonfalon, or standard of St. Mark. The gold florins of Florence, with the lily for device, are no less celebrated, and were imitated by other states. Florence had also a remarkable series of medals, with admirable portraits of persons of note. The coins of the popes, from Hadrian I. down to the 14th c., bear the name of the pope and emperor of the west; those of later date are beautiful in execution, and have seated portraits of the pontiffs, with the cross-keys and miter for reverse. A remarkable series of medals commemorates the chief events of each reign, one of which, struck after the massacre of St. Bartholomew, has for type an angel slaying the Huguenots, and the inscription "Ugonottorum strages." The coins of the Norman princes of Naples struck in Sicily, have the legends partly or wholly in Arabic. Malta has a series, with the arms and effigies of the grand-masters.

The mediæval money of Germany comprises coins of the emperors, the electors, the smaller princes, the religious houses, and the towns. The imperial series is extensive and very interesting, though, till near the close of the middle ages, it is rather backward in its art. About the reformation period, however, there are vigorous portraits both on its current coins and on the medals, and those double-dollars which are virtually medals. The coins of the dukes of Saxony, with their portraits are equally remarkable. The coins of the archbishops of Cologne, Mainz, and Treves form a very interesting series, the first more especially, with a representation of the cathedral.

The coins of the Low Countries resemble those of France and Germany. The Dutch medals are of interest, more especially those struck in commemoration of events in the war with Spain.

The coins of the Swiss cantons and towns during the early period of Swiss independence bore the heraldic shield of each, drawn with vigorous grotesqueness. There are also pieces struck by ecclesiastical lords, and by different families who had a right of coinage.

The coins of Spain begin with those of the Gothic princes, which are chiefly of gold, and on the model of the trientes and semisses of the lower empire. Some of the early pieces have a rude head of the monarch on one side, and of the emperor on the other. Afterwards, the obverse bears the profile of the monarch, and the reverse a cross of some description, with the name of the place of mintage, and the word "Pius" for legend. In later times, there are two interesting series of coins belonging to the kingdom of Aragon and to the kingdom of Castile and Leon.

The coinages of Norway and Sweden at first resembled the British, and afterwards the German type. From the 10th to the 14th c., bracteates were issued by the ecclesiastics. The coinage of Hungary begins in the 11th c., and has the portraits of the monarchs. The Russian coinage is Byzantine in character, and rude in its art. The earliest pieces are the silver darga of the 14th c., of an oblong shape, with representations of the prince on horseback, and various legendary subjects. Peter the great introduced the usual European type. There is an important series of bronze coins of the crusaders, beginning with Tancred, and coming down to the end of the 15th c., including money of the kings of Cyprus and Jerusalem, and other princes established in the east.

In India, the succession of the kings of Bactria, the remotest of the dynasties founded on the ruins of Alexander's empire, has only become known through their recently discovered coins. There are early rude Hindu coins of the Gupta line, with figures of the Brahmanic divinities of a type still in use.

Of the coins of the Mohammedan princes, the oldest gold pieces are the bilingual coins of cities of Syria and Palestine, of the middle of the 7th c. (A.H. 78, barbarous imitations of the latest Byzantine money of Alexandria. Most of the Mohammedan coins are covered exclusively by inscriptions expressive of the elementary principles of the Mohammedan faith. For some centuries, no sovereign except the caliph was allowed to inscribe his name on the coin. Large gold coins of great purity were issued by the Moslem kings of Granada in Spain.

The high prices given for ancient coins have led to numerous forgeries from the 15th c. downwards. Against such imitations, collectors require to be on their guard.

Among the best works on numismatics are Eckhel, *Doctrina Numorum Veterum* (Vienna, 1792–98); Hennin, *Manuel de Numismatique Ancienne* (Paris, 1830); Grasset, *Handbuch der alten Numismatik* (Leipsic, 1852–53); Leake, *Numismata Hellenica* (London, 1854); Ruding's *Annals of the Coinage of Great Britain* (London, 1840); Patrick's *Records of the Coinage of Scotland* (1877); Leblanc, *Traité Historique des Monnoies de France* (Paris, 1690); Cappe, *Die Münzen der Deutschen Kaiser* (1850); Marsden, *Numismata Orientalia Illustrata* (London, 1823–25); Boutkovski, *Dictionnaire Numismatique* (Leip. 1877).

NUMITOR. See ROMULUS, *ante*

NUM'MULITE LIMESTONE, an important member of the Middle Eocene period, consisting of a limestone composed of nummulites held together by a matrix formed of the comminuted particles of their shells, and of smaller foraminifera. It forms immense masses of the strata which are raised up on the sides of the Alps and Himalayas, and may be traced as a broad band often 1800 m. in breadth, and frequently of enormous thickness, from the Atlantic shores of Europe and Africa, through western Asia, to northern India and China. It is known also to cover vast areas in North America.

NUMMULITES, or NUMMULINA (Gr. money-fossil), a genus of fossil foraminefera, the shells of which form immense masses of rock of Eocene age. See NUMMULITE LIMESTONE. Upwards of 50 species have been described. They are circular bodies of a lenticular shape, varying in magnitude from the merest point to the size of a crown-piece. The shell is composed of a series of small chambers arranged in a concentric manner. The growth of the shell does not take place only around the circumference, but each whorl invests all the preceding whorls, so as to form a new layer over the entire surface of the disk, thus adding to the thickness as well as the breadth, and giving the fossil its lenticular form. A thin intervening space separates each layer from the one which it covers, and this space at the margin swells out to form the chamber. All the internal cavities, however, seem to have been occupied with the living sarcode, and an intimate connection was maintained between them by means of innumerable parallel tubuli, which everywhere pass from one surface to another, and which permitted the passage of the sarcode as freely as do the minute pores or foramina of the living foraminifera.

The name is given to them from their resemblance to coins. In Egypt, where the whole of the Mokkadam mountains, from the stone of which the pyramids were built, is formed of them, they are called by the natives "Pharaoh's Pence."

NUN, a member of a religious order of women. The etymology of this name is a subject of some controversy, but there seems every reason to believe that it is from a Coptic or Egyptian root, which signifies "virgin." It is found in use as a Latin word as early as the time of St. Jerome (*Ep. to Eustachius*, p. 22, c. 6). The general characteristics of the religious orders will be found under the head MONACHISM (q.v.), and under those of the several orders. It is only necessary here to specify a few particulars peculiar to the religious orders of females. Of these the most striking perhaps is the strictness in the regularly authorized orders of nuns of the "cloister," or inclosure, which no extern is ever permitted to enter, and beyond which the nuns are never permitted to pass, without express leave of the bishop. The superiors of convents of nuns are called by the names abbess, prioress, and, in general, mother superior. They are, ordinarily speaking, elected by chapters of their own body, with the approval of the bishop, unless the convent be one of the class called exempt houses, which are immediately subject to the authority of the Holy See. The ceremony of the solemn blessing or inauguration of the abbess is reserved to the bishop, or to a priest delegated by the bishop. The authority of the abbess over her nuns is very comprehensive, but a precise line is drawn between her powers and those of the priestly office, from which she is strictly debarred. The name of nun is given in general to the sisters of all religious congregations of females who live in retirement and are bound by rule; but it is primitively and properly applicable only to sisters of the religious orders strictly so called. See MONACHISM.

NUNC DIMIT'TIS, the name given to the canticle of Simeon (Luke ii., 29–32), which forms part of the compline office of the Roman breviary, and is retained in the evening service of the Anglican church when it follows the second lesson. On the great festivals in Lent, the music of this canticle is especially grand and imposing.

NUNCIO (Ital. *nunzio*, Lat. *nuncius*, a messenger), the name given to the superior grade of the ambassadors sent by the pope to foreign courts, who are all called by the general name of LEGATE (q. v.). A nuncio is an ambassador to the court of an emperor or king. The ambassador to a republic, or to the court of a minor sovereign, is called INTERNUNCIO.

NUNCU'PATIVE WILL is a will made by word of mouth. As a general rule, no will is valid unless it is in writing and signed by the testator; but in cases of soldiers and sailors, a verbal or noncupative will is held to be good, on the ground that there is often no time to draw up a formal will in writing.

NUNEATON, a small market-t. of England, in the county of Warwick, and 18 m. n. e. of the town of that name. It contains a small parish church in Gothic, and its free grammar school was founded by Edward VI. in 1553. Ribbons and cotton goods are manufactured. Pop. '81, 8,465.

NUÑEZ, ALVAR (CABECA DE VACA), 1490–1564; b. Spain, second in command to Pamfilo de Narvaez in the unfortunate expedition to Florida in 1527. After the latter was lost while attempting to make his way to Mexico, Nuñez, with a few other survivors of the expedition, succeeded in landing on the continent at some point w. of the Mississippi river, and went n. w. to a country supposed to have been what is now New Mexico. The party had endured great hardship on the journey, but were well cared for by friendly Indians, among whom they passed eight months. They then went on towards the s. w., and after terrible suffering, only Nuñez and three companions survived to arrive at the Spanish colonies on the Pacific. This was in 1536, eight years after the shipwreck of Narvaez. Nuñez went back to Spain, but in 1540 started for La Plata, of which he had been appointed governor. His vessel was wrecked, and he landed in Paraguay, which he at once began to explore, passing down the La Plata through the country of the Guaranís, to Asuncion, which he made his headquarters. He conquered several Indian tribes, but was at one time defeated, and soon afterward

on the accusations of Domingo de Irala, his second in command, he was sent to Spain for trial, found guilty, and banished to Africa. Recalled by the king at the end of eight years, he was made judge of the supreme court of Seville, and continued in that office till his death. *The Shipwrecks of Alvar Nuñez*, with the *Commentaries of Alvar Nuñez*, written by his secretary, Fernandez, appeared at Valladolid in 1544. His story is found in an abridged form in Hakluyt's *Voyages*, and an English translation of the whole was published by Buckingham Smith at Washington in 1852.

NUNQUAM INDEBITATUS, a law term meaning, in an action for debt, a plea that the defendant never was indebted. By the Judicature act of 1875, the defendant is no longer allowed to deny generally the facts alleged by the plaintiff.

NUPHAR. See WATER-LILY, *ante*.

NURAGHE, the name of certain structures, of conical shape, in the island of Sardinia, rising 30 or 40 ft. above the ground, with two or three stories of domed chambers connected by a spiral staircase. Some are raised on basements of masonry or platforms of earth. They are made of granite limestone, basalt, porphyry, sandstone, and schist. Their entrances are small and low, and when they have chambers of two stories, the upper chamber is reached by the spiral staircase, which has loopholes to admit the light. The tops are supposed to have had a terrace. Although 3,000 of them exist, none are perfect. Their masonry is irregular, but not polygonal, and resembles the style of work called Asiatic. Like the round towers of Ireland, and other uninscribed monuments, their object and antiquity are enveloped in much doubt. They have been supposed to be the work of the Pelasgi, the Phenicians, or Carthaginians, and to have been ancient sepulchres, *Tholi* or *Daedalia*, constructed in heroic times. Skeletons, and other funeral paraphernalia, have been found in them. They have many points of resemblance to the "Burghs" or "Duns" on the northern shores of Scotland, of which the Burgh of Mousa, in Shetland, is perhaps the best example.—De la Marmora, *Voyage en Sardaigne*, tom. ii.; Petit Radel, *Nuraghes* (Paris, 1826–28); Micali, *Ant. Pop. Ital.* ii. pp. 43; Dennis, *Cities and Cem. of Etruria*, ii, pp. 161.

NUREDDIN'. See NOUREDDIN, *ante*.

NUREMBERG or NÜRNBERG (*Norimberga*, *Norica*), a fortified city of the Bavarian province of middle Franconia, situated in 49° 28′ n. lat., and 11° 5′ e. long. Pop. '71, 80,000; '81, 99,519. Nuremberg is one of the most remarkable and interesting cities of Germany, on account of the numerous remains of medieval architecture which it presents in its picturesque streets, with their gabled houses, stone balconies, and quaint carvings. No city retains a stronger impress of the characteristics which distinguish the wealthy burgher-classes in the middle ages, while its double lines of fortified walls, separated from each other by public walks and gardens, and guarded by 70 towers, together with the numerous bridges which span the Pegnitz, on whose banks the city is built, give it distinctive features of its own. Among the most remarkable of its numerous public buildings are the old palace or castle, commanding, from its high position, a glorious view of the surrounding country, and interesting for its antiquity, and for its gallery of paintings, rich in gems of early German art; the town-hall, which ranks amongst the noblest of its kind in Germany, and is adorned with works of Albert Dürer, and Gabriel Weyher; the noble Gothic fountain opposite the cathedral by Schonhofer, with its numerous groups of figures, beautifully restored in modern times; and many other fountains deserving notice. Of the numerous churches of Nuremberg, the following are the most remarkable: St. Lawrence, built between 1270–1478, with its beautiful painted-glass windows, its noble towers and door-way, and the celebrated stone pyx, completed in 1500, by Adam Kraft, after five years' assiduous labor; and the exquisite wood carvings of Veit Stoss; St. Sebald's, with its numerous fine glass-paintings and frescoes by Peter Visscher and other German masters; the cathedral, or Our Lady's, built in 1631, similarly enriched. Nuremberg is well provided with educational establishments, and besides a good gymnasium and polytechnic institution, has good schools of art, normal and other training colleges, a public library of 50,000 vols., galleries of art collections, museums, etc.; while the numerous institutions of benevolence are liberally endowed and well maintained. Although the glory of the foreign commerce of Nuremberg may be said to have been long extinct, its home trade, which is still of considerable importance, includes the specialties of metal, wood, and bone carvings, and children's toys and dolls, which find a ready sale in every part of Europe, and are largely exported to America and the east. In addition to its own industrial commerce, is the seat of a large transfer and exchange business, which owes much of its importance to the facilities of intercommunication afforded by the net-work of railway lines with which the city is connected.

Nuremberg was raised to the rank of a free imperial city by the Emperor Henry V., in 1219, previous to which time, Henry IV. had enobled 38 of the principal burgher families, who forthwith arrogated to themselves supreme power over the Nuremberg territory. In the 13th c., we find it under the title of a burg-graviate in the hands of the Hohenzollern family, who, in 1417, ceded for a sum of money all their territorial and manorial rights to the magistracy of the city. This measure put a stop to the feuds which had hitherto raged between the burggrafs and the municipality, and for a time

Nuremberg continued to grow rich with the fruits of the great internal trade which it had long maintained between the traders of the east and the other European marts of commerce. The discovery of the passage by the cape of Good Hope, by opening new channels of communication between Asia and Europe, deprived Nuremberg of its ancient monopoly. The thirty years' war completed the decay of the city, which suffered severely from both parties in turn. The ancient reputation of Nuremberg as a wealthy and loyal city of Germany secured to it, however, special consideration; and in 1803 when the imperial commissioners reorganized some of the dismembered parts of the old empire, it was allowed to retain its independence, with a territory of 483 sq.m., containing 40,000 inhabitants, and drawing a revenue of 800,000 guldens; but in consequence of the disputes in which the free city became involved with the king of Prussia, who had some hereditary claim on the ancient burg-graviate, Nuremberg, alarmed at the prospect of still greater embarrassments, entered into the Rhenish confederation, and as the result of this alliance, was transferred, in 1806, with the surrender of its entire domain and all rights of sovereignty, to the king of Bavaria.

NUREMBERG, Diets of, 1522–23, important church councils of the reformation. After the invasion of Hungary by Soliman the Turk the emperor Charles V. convened a diet at Nuremberg, Mar. 22, 1522, to concert measures against the Turks, and settle internal religious difficulties. The emperor wrote to pope Adrian VI., urging him to confirm the decisions of the diet, and to use his money to destroy the heresy of Luther. Pope Adrian sent his chamberlain with a brief to the elector of Saxony, requesting him in the next diet "to protect and maintain the dignity and majesty of the apostolic see, and with it the peace of christendom," as his ancestors had done. Frederick replied that while he chiefly sought the glory of God and the peace of the empire, Luther and his followers must be met with reason, not force. The pope then represented to Francis Chieregati, his legate at Nuremberg, that Luther and his adherents were not only heretics, but dangerous to the state, and therefore must be suppressed. In another brief to the elector he charged him with being the friend of heretics. He also forbid his protecting Luther under penalty of ecclesiastical and civil punishment. At the diet which convened Dec. 13, 1522, Hans von Plaunitz, a friend of Luther, represented Frederick. Chieregati, the pope's legate, presented a papal brief to the diet demanding that the Lutheran preachers should be arrested and sent to Rome to be judged. This the diet refused, and made a vigorous reply to the brief. Appearing again in 1523 before the diet the legate demanded the enforcement of the decrees of the diet of Worms against Luther's heresy, declaring at the same time that the bad state of the church was due to the laxity of discipline in the clergy, and also to the bad example of some of the popes. The pope also confessed freely the need of reformation in the church, and promised to do all in his power for its improvement. Both parties were displeased with these statements of the legate; the papal, because the pope confessed the evil condition of the church, and censured his predecessors; the reformers, ridiculing the promise of the pope to introduce reforms. A committee was appointed by the state to prepare a reply to the legate; and this favored the Protestant principles, declaring that the abuses of the Roman court, the immorality of the clergy, the violation of the concordats, etc., had been fully shown by Luther, making in all 81 different counts. The reply also demanded that a free council should be held at some city of Germany, engaging that Luther and his adherents should not make disturbance by preaching or writing. The legate, in reply, insisted on the execution of the terms of the edict of the diet of Worms. Philip von Feilitzsch, the envoy of the elector of Saxony, protested against the agreement that Luther and his followers should publish nothing until the meeting of the council. Luther also wrote to the elector Frederick, claiming the same freedom to defend himself that the opposite party had to attack him; that the stipulation not to publish until the settlement of the difficulties could not apply to the publishing of the Bible or the preaching of the gospel, as the word of God could not be bound. The acts of the diet disappointed the pope; the emperor disregarded his appeals, because of his interference in the affairs of France, and Adrian died of grief.

The condition of things in Germany and the change in the papal see led to another diet at Nuremberg, Nov. 11, 1523. Cardinal Lorenzo Campeggio was the legate of the new pope, Clement VII. The diet was opened Jan. 14, 1524. The majority showed itself opposed to the pope. They discussed the necessity of furnishing assistance to the king of Hungary, of contributing to the war against the Turks, and of removing the seat of government from Nuremberg to Esslingen. This displeased the emperor as well as the pope, and Hanart, in behalf of the emperor, and Campeggio for the pope, demanded the dissolution of the diet. Campeggio showed the danger to the empire in any departure from the ancient faith; the states referred him to the grievances complained of in a former diet. The legate replied that the pope had received no official communication of those grievances, and insisted on the carrying out of the edict of Worms. Frederick's representative declared that he had received no official communication of the edict of Worms; that the late diet had not forbidden evangelical preaching, and that its decisions could not be set aside without discussion. The diet dissolved April 18. The seat of government was removed to Esslingen, aid was granted to the king of Hungary and for the war against the Turks. The states decided also, that the pope should, with the assent of the emperor, cause a free council to be held in Germany as soon as possible, and that,

in the meantime, another diet at Spires should specify the grievances of the princes against the pope, and decide on the manner of holding the aforementioned council; until then the princes should carefully watch all new doctrines and books, but see also that the gospel should be freely and peaeefully preached and explained, as generally received by the church. The emperor was prevented by complications with France from much impeding the reformation. The pope's legate sought to organize a Roman Catholic league in opposition to the evangelical princes and states, and even attempted to gain over Melanchthon. The reformation rapidly gained ground. In 1542 and 1543 two other diets were held, but they were not very important. Political difficulties and dissatisfaction because the promised reforms had not been carried out, led to another diet, which was held Jan. 31, 1543, in which the Roman Catholics opposed all reform, and the other party aeted with vigor. King Ferdinand urged the prosecution of the war against the Turks with increased energy, of protecting Hungary and the neighboring regions, and of granting aid against the French, who had invaded the Netherlands. The evangelical princes and states presented to the king and to the imperial eommissioners a list of their grievances. They eomplained of the peace of Nuremberg having been broken by the imperial chamber of justice, and of the promised reforms not having been carried out. They required also religious liberty. All the questions gave rise to numerous debates, whieh related mostly to the political affairs of the empire. The proposed council, which was to be held at Trent, the evangelieal party refused to accept, and, as no sure guarantees of peace were given them, they declined to take any further part in the proeeedings of the diet. The resolutions of the diet were therefore passed without the participation of the reform party.

NURSE, a colloquial name given to several species of sharks. In New England it is used of the *somniosus microcephalus;* in Florida to the *ginglymostoma cirratum;* and in the Pacific to the *cestracion philippè.*

NURSE, Military. In continental armies the "sisters of charity" usually carry their mission of mercy into the military hospitals. Protestant England having no such organization to fall back upon, the soldiers have been dependent on the regular male hospital attendants for their care during siekness, or when suffering from wounds. The Crimean campaign, however, disclosed so melancholy a picture of the want of women's co-operation, that a band of self-sacrificing ladies, headed by Miss Nightingale (q.v.), proceeded to Turkey, and were soon acknowledged as messengers of health and life by the unfortunate wounded. The example thus set has not been without effect. In the Franco-German war of 1870–71 lady-nurses of various nations ministered in all the military hospitals, and the like took place during the Russo-Turkish war of 1877–78.

NURSERY, a garden or portion of a garden devoted to the raising of young plants, to be afterward planted elsewhere. The ripening of garden-seeds for sale is generally also an important part of the trade of the public nurseryman. Many culinary vegetables are very commonly raised from seed in public nurseries, and sold as young plants; the trouble of raising them in small gardens being found too great, although, when there is no public nursery at hand, even the cottage gardener may be compelled to undertake this trouble for himself, in order to procure a supply of young kale, eabbage, cauliflower, etc., in fresh and healthful condition. Many flowering plants, as wallflower, stock, sweet-william, etc., are also raised and sold by nurserymen. Another great use of the nursery is the rearing of fruit-trees. In the nursery the stocks are raised from seed, the grafting is performed, and the training of the young tree, whether for standard, espalier, or wall tree, is begun. As, with regard to fruit-trees, the selection of grafts is of the utmost importance, the reputation of the nurseryman is particularly to be considered by the purchaser; nor is there any trade in which this is more generally necessary, months, or sometimes years elapsing before the quality of the goods purchased can be experimentally aseertained. The principal, and many of the smaller towns of Britain are well supplied with public nurseries, which is the case also in many countries of continental Europe and in North America. Some of these nurseries are on a very great scale, as those of Messrs. Loddige of London, Lawson of Edinburgh, and Booth of Hamburg. The largest nurseries, however, are very much devoted to the rearing of ornamental shrubs and trees, and of forest-trees. Plantations of forest-trees, even when very extensive, are now generally, although not always, made with plants obtained from public nurseries. The exertions made by nurserymen to obtain new plants from foreign countries, have contributed much, not only to the advancement of gardening in its various departments, and of arboriculture, but also of botany.—Much benefit also results from the exchange of the produce of the nurseries of different countries. Thus, bulbous roots are brought to Britain from Holland, from what may be described as nurseries specially devoted to them; roses and orange-trees are imported from the nurseries of France, etc. It often happens that seeds imported from climates more thoroughly adapted to the plants, produce better crops than those raised in a colder climate or under a cloudier sky

NURSES, Training of. See page 892.

NUSAIRIEH, Nossairians or Ansonians. See Ansaries.

NUT, in popular language, is the name given to all those fruits which have the seed inclosed in a bony, woody, or leathery pericarp, not opening when ripe. Amongst the

best known and most valuable nuts are the hazel-nut, Brazil nut, walnut, chestnut, and cocoa-nut, all of which are edible. Other nuts are used in medicine, and for purposes connected with the arts. Some of the edible nuts abound in a bland oil, which is used for various purposes.—In botany the term nut (*nux*) is used to designate a one-celled fruit, with a hardened pericarp, containing, when mature, only one seed. The *achenium* (q.v.) was by the older botanists generally included in this term. Some of the fruits to which it is popularly applied scarcely receive it as their popular designation. The hazel-nut is an excellent example of the true nut of botanists.—The name nut, without distinctive prefix, is popularly given in Britain to the hazel-nut, but in many parts of Europe to the walnut.

Many nuts have a considerable commercial value, from their being favorite articles of food; these are the hazel-nut and its varieties, the black Spanish, the Barcelona, the Smyrna, the Jerusalem filbert, and the common filbert; the walnut, chestnut, hickory, and pecan; the souari, the cocoa or coker nuts, and the Brazil or Para nut.

The Barcelona and black Spanish, as their names imply, are from Spain; the former is the commonest nut of our shops. About 120,000 bags, averaging 1¼ bushel each, or 150,000 bushels, are annually imported into Great Britain. The import value is about 33s. per bag. They are always kiln-dried when we receive them. This is not the case with the black Spanish, of which only about 12,500 three-bushel bags, or about 37,000 bushels, are imported in the beginning of the season, when their value is about 14s. per bushel. From the Black sea we receive annually about 68,000 bushels of hazel-nuts, worth 10s. per bushel, with from 500 to 1000 bags of the so-called Jerusalem and Mount Atlas filberts. Of chestnuts, from Leghorn, Naples, Spain, France, and Portugal, we receive annually about 20,000 bushels. The trade in walnuts is very uncertain, and probably never exceeds 5,000 bushels. Of the curious three-cornered or Brazil nut from Para and Maranham, the importation is also very irregular, varying from 300 to 1000 tons, or 1200 to 4,000 bushels per annum. About two millions of cocoa-nuts are also imported. The other kinds of nuts are too irregular in their importations to supply any reliable statistics. In '80 the value of all the nuts imported for use as fruit was computed at about £510,277.

NUTATION is a slight oscillatory movement of the earth's axis, which disturbs the otherwise circular path described by the pole of the earth round that of the ecliptic, known as the "precession of the equinoxes." It is produced by the same causes, viz., the attraction of the sun, moon, and planets (the attraction of the last mentioned being so small as to be quite imperceptible) upon the bulging zone about the earth's equator, though in this case it is the moon alone that is the effective agent. It also, for reasons which need not be given here, depends, for the most part, not upon the position of the moon in her orbit, but of the moon's node. If there was no precession of the equinoxes, nutation would appear as a small elliptical motion of the earth's axis, performed in the same time as the moon's nodes take to complete a revolution, the axes of the ellipse being respectively 18″.5 and 13″.7, the longer axis being directed towards the pole of the ecliptic. But this motion, when combined with the more rapid one of precession causes the pole of the earth's axis to describe a wavy line round the pole of the ecliptic.

The effect of nutation, when referred to the equator and ecliptic, is to produce a periodical change in the obliquity of the ecliptic, and in the velocity of retrogradation of the equinoctial points. It thus gives rise to the distinction of "apparent" from "mean" right ascension and declination, the former involving, and the latter being freed from the fluctuations arising from nutation. This motion is common to all the planets.

NUT-CRACKER, *Nucifraga* or *Caryocatactes*, a genus of birds of the family *corvidæ*, with a straight conical bill, both mandibles terminating in an obtuse point, and tail nearly square at the end. The form and characters are nearly similar to those of crows, but the habits are rather those of jays, and in some respects indicate an approach to woodpeckers. One species (*N. caryocatactes* or *C. nucifraga*) is occasionally seen in Britain, and is not uncommon in many parts of Europe and of Asia, particularly in mountainous regions covered with pines. It is about the size of a jackdaw, but has a longer tail. The plumage is light brown, speckled with white, except on the wings, rump, and tail, which are nearly black. The nut-cracker frequents the tops of high pines, and is a shy bird.

NUTGALL. See Galls, *ante*.

NUT-HATCH, *Sitta*, a genus of birds of the family *certhiadæ*, having a straight conical or prismatic bill, short legs, the hind-toe very strong. They run up and down trees with great agility, moving with equal ease in either direction, and without hopping, so that the motion is rather like that of a mouse than of a bird. They feed on insects, in pursuit of which they examine the crevices, and remove the scales of the bark; also on seeds, as those of pines, and the kernels of nuts, to obtain which they fasten the nut firmly in some crevice of bark or other such situation, and peck at it until the shell is broken, so placing themselves that they sway not merely the head, but the whole body, to give force to the stroke. The English name is said to have been originall *nut-hack*. One species, the European Nut-hatch (*S. Europæa*), is common in most parts of Europe, and is found in most of the wooded districts of England. Its whole length is about six inches.

If taken young, it is easily tamed, and becomes very familiar and amusing; but an old bird caught and put into a cage, is apt to kill itself by violently pecking to force a way out. It soon destroys the wood of a cage.—Other species are found in the east and in North America, where the genus is particularly abundant. Birds nearly allied are found in Australia.

NUTMEG. This well-known and favorite spice is the kernel—mostly consisting of the albumen—of the fruit of several species of *myristica*. This genus belongs to a natural order of exogens called *myristicaceæ*, which contains about forty species, all tropical trees or shrubs, natives of Asia, Madagascar, and America. They generally have red juice, or a juice which becomes red on exposure to air. The order is allied to *lauraceæ* The leaves are alternate and without stipules. The flowers are unisexual, the perianth generally trifid, the filaments united into a column. The fruit is succulent, yet opens like a capsule by two valves. The seed is nut-like, covered with a laciniated fleshy aril, and has an albumen penetrated by its membranous covering. The species of this order are generally more or less aromatic in all their parts; their juice is styptic and somewhat acrid; the albumen and aril contain both a fixed and an essential oil, and those of some species are used as spices. The genus *myristica* has the anthers united in a cylindrical column, and the cotyledons folded. The species which furnishes the greater part of the nutmegs of commerce is *M. fragrans* or *moschata;* but the long nutmeg (*M. fatua*), from the Banda isles, is now not uncommon in our markets. The common nutmeg-tree is about 25 ft. in height, with oblong leaves, and axillary few-flowered racemes; the fruit is of the size and appearance of a roundish pear, golden yellow in color when ripe. The fleshy part of the fruit is rather hard, and is of a peculiar consistence, resembling candied fruit; it is often preserved and eaten as a sweetmeat. Within is the nut, enveloped in the curious yellowish-red aril, the *Mace* (q.v.), under which is a thin shining brown shell, slightly grooved by the pressure of the mace, and within is the kernel or nutmeg. Up to 1796, the Dutch being the possessors of the Banda isles, jealousy prevented the nutmeg from being carried in a living state to any other place; but during the conquest and retention of the islands by the British, care was taken to spread the culture of this valuable spice, and plants were sent to Penang, India, and other places, where they are now successfully cultivated; indeed, they have now become established in the West India Islands, and both Jamaica and Trinidad produce excellent nutmegs. Brazil is also found favorable to their culture. The nutmeg is very liable to the attack of a beetle, which is very destructive, and it is a common practice to give them a coating of lime before shipping them to Europe, in order to protect them from its ravages. The Dutch or Batavian nutmegs are nearly always limed, but those from Penang are not, and are consequently of a greater value. The nutmeg yields, by expression, a peculiar yellow fat, called oil of mace, because, from its color and flavor, it was generally supposed to be derived from mace; and by distillation is obtained an almost colorless essential oil, which has very fully the flavor of the nutmeg. Her own settlements now furnish Great Britain with the greater portion of this spice, but some lots of Batavian also come into the market. The quantity imported may be stated as 300,000 pounds' weight, worth, in round numbers, £70,000.

Nutmegs are chiefly used as a spice; but medicinally they are stimulant and carminative. They possess narcotic properties, and in large doses produce stupefaction and delirium, so that they ought not to be used where affections of the brain exist or are apprehended.

Other species of *myristica* besides those already named yield nutmegs sometimes used, but of very inferior quality.—The fruits of several species of *lauraceæ* also resemble nutmegs in their aromatic and other properties; as the cotyledons of *Nectandra Puchury*, the Pichurim beans of commerce, and the fruit of *acrodiclidium camara*, a tree of Guiana, the camara or ackawai nutmeg. The clove nutmegs of Madagascar are the fruit of *agathophyllum aromaticum*, and the Brazilian nutmegs of *Cryptocarya moschata*. All these belong to the order *lauraceæ*. The Calabash nutmeg is the fruit of *monodora myristica*, of the natural order *anonaceæ*.

NUTRIA. See Coypu and Racoonda.

NUTRITION. The blood which is carried by the capillaries to the several tissues of the body is the source from whence all the organs derive the materials of their growth and development; and it is found that there is direct proportion between the vascularity of any part and the activity of the nutrient operations which take place in it. Thus, in nervous tissue and muscle, in mucous membrane and in skin, a rapid decay and renovation of tissue are constantly going on, and these are parts in which the capillaries are the most abundant; while in cartilage and bone, tendon and ligament, the disintegration of tissue is comparatively slow, and the capillaries are much less abundant. Each elementary cell or particle of a tissue seems to have a sort of gland-like power not only of attracting materials from the blood, but of causing them to assume its structure, and participate in its properties. Thus, from the same common source, nerves form nervous tissue, muscles muscular substance, and even morbid growths, such as cancer, have an assimilating power.

Before entering further into the subject of nutrition, it is necessary to understand how it differs from the allied processes of development and growth. All these processes are

the results of the plastic or assimilative force by which living bodies are able to form themselves from dissimilar materials (as when an animal subsists on vegetables, or when a plant grows by appropriating the elements of water, carbonic acid, and ammonia); but they are the results of this force acting under different conditions.

Development is the process by which each tissue or organ of a living body is first formed, or by which one, being already incompletely formed, is so changed in shape and composition as to be fitted for a function of a higher kind, or finally is advanced to the state in which it exists in the most perfect condition of the species.

Growth, which commonly concurs with development, and continues after it, is properly mere increase of a part by the insertion or superaddition of materials similar to those of which it already consists. In growth, properly so called, no change of form or composition occurs; parts only increase in weight, and usually in size; and if they acquire more power, it is only more power of the same kind as that which they before enjoyed.

Nutrition, on the other hand, is the process by which the various parts are maintained in the same general conditions of form, size, and composition, which they have already by development and growth attained. It is by this process that an adult person in health maintains for a considerable number of years the same general outline of features, and nearly the same size and weight, although during all this time the several tissues of his body are undergoing perpetual decay and renovation. In many parts this removal and renewal of the particles is evident. In the glands—the kidneys (q.v.), for example—the cells of which they are mainly composed are being constantly cast off; yet each gland maintains its form and proper composition, because for every cell that is thrown off a new one is produced. In the epidermis of the skin, a similar process is perpetually going on before our eyes. In the muscles a similar change may be readily traced, for, within certain limits, an increased amount of exercise is directly followed by an increased excretion of the ordinary products of the decomposition of the nitrogenous tissues—viz. urea, carbonic acid, and water. Again, after prolonged mental exertion, there is often a very marked increase in the amount of alkaline phosphates in the urine, which seems to show that in these cases there is an excessive oxidation of the phosphorus of the brain; and yet, in consequence of the activity of the reparative process, neither the muscles nor the brain diminish in size.

It may be regarded as an established fact in physiology that every particle of the body is formed for a certain period of existence in the ordinary conditions of active life, at the end of which period, if not previously destroyed by excessive exercise, it is absorbed or dies, and is cast off. (The hair and deciduous or milk teeth afford good illustrations of this law.) The less a part is exercised the longer its component particles appear to live. Thus Mr. Paget found that if the general development of the tadpole be retarded by keeping it in a cold, dark place, and if hereby the funtions of the blood corpuscles be slowly and imperfectly discharged, the animal will retain its embryonic state for several weeks longer than usual, and the development of the second set of corpuscles will be proportionally postponed, while the individual life of the corpuseles of the first set will be, by the same time, prolonged.

For the due performance of the function of nutrition certain conditions are necessary, of which the most important are—1, a right state and composition of the blood, from which the materials of nutrition are derived; 2, a regular and not far distant supply of such blood; 3, a certain influence of the nervous system; and 4, a natural state of the part to be nourished.

1. There must be a certain adaptation peculiar to each individual between the blood and the tissues. Such an adaptation is determined in its first formation, and is maintained in the concurrent development and increase of both blood and tissues. This maintenance of the sameness of the blood is well illustrated by the action of vaccine matter. By the insertion of the most minute portion of the virus into the system, the blood undergoes an alteration which, although it must be inconceivably slight, is maintained for several years; for even very long after a successful vaccination, a second insertion of the virus may have no effect, because the new blood formed after the vaccination continues to be made similar to the blood as altered by the vaccine matter. So, in all probability, are maintained the morbid states of the blood which exist in syphilis and many other chronic diseases; the blood once inoculated, retaining for years the taint which it once received. The power of assimilation which the blood exercises in these cases is exactly comparable with that of maintenance by nutrition in the tissues; and evidence of the adaptation between the blood and the tissues, and of the delicacy of the adjustment by which it is maintained, is afforded by the phenomena of symmetrical diseases (especially of the skin and bones), in which, in consequence of some morbid condition of the blood, a change of structure affects in an exactly similar way the precisely corresponding parts on the two sides of the body, and no other parts of even the same tissue. These phenomena (of which numerous examples are given in two papers by Dr. W. Budd and Mr. Paget in the 25th vol. of the *Medico-chirurgical Transactions*) can only be explained on the assumption—1st, of the complete and peculiar identity in composition in corresponding parts of opposite sides of the body; and 2dly, of so precise and complete an adaptation between the blood and the several parts of each tissue, that a morbid material being present in the blood, may destroy its fitness for the nutrition of one or

two portions of a tissue, without affecting its fitness for the maintenance of the other portions of the same tissue. If, then, the blood can be fit for the maintenance of one part, and unfit for the maintenance of another part of the same tissue (as the skin or bone), how precise must be that adaptation of the blood to the whole body, by which in health it is always capable of maintaining all the different parts of the numerous organs and tissues in a state of integrity.

2. The necessity of an adequate supply of appropriate blood in or near the part to be nourished, is shown in the frequent examples of atrophy of parts to which too little blood is sent, of mortification when the supply of blood is entirely cut off, and of defective nutrition when the blood is stagnant in a part. The blood-vessels themselves take no share in the process, except as the carriers of the nutritive matter; and provided they come so near that the latter may pass by imbibition, it is comparatively unimportant whether they ramify within the substance of the tissue, or (as in the case of the non-vascular tissues, such as the epidermis, cornea, etc.) are distributed only over its surface or border.

3. Numerous cases of various kinds might be readily adduced to prove that a certain influence of the nervous system is essential to healthy nutrition. Injuries of the spinal cord are not unfrequently followed by mortification of portions of the paralyzed parts; and both experiments and clinical cases show that the repair of injuries takes place less completely in parts paralyzed by lesion of the spinal cord than in ordinary cases. Division of the trunk of the trifacial nerve has been followed by incomplete nutrition of the corresponding side of the face, and ulceration of the cornea is a frequent consequence of the operation.

4. The fourth condition is so obvious as to require no special illustration.

For furthur information on this most important department of physiology, the reader is referred to Mr. Paget's *Surgical Pathology*, or to his original lectures on nutrition, hypertrophy, and atrophy (published in vol. 39 of *The Medical Gazette*) or to the chapter on "Nutrition and Growth," in Kirke's *Handbook of Physiology*, which contains an excellent abstract of Mr. Paget's views, and to which we are indebted for the greater part of this article.

NUTRITION (*ante*). This subject is exhaustless. It comprehends all vital phenomena, for none of the functions of life are performed without involving replacement by living matter, and therefore nutrition. The subject of hygiene in all its aspects is connected with it, whether in eating, drinking, exercise, sleeping, or breathing. A change in each of these processes involves a corresponding change in the elaboration and appropriation of new material, and the disassimilation, or elimination of old, or its reconversion. This includes the functions of digestion (q.v.), chylification, sanguification, circulation (q.v.), respiration (q.v.), assimilation, secretion (q.v.), metabolic change, and excretion. Nutrition, to be healthy, requires the respiration of pure air, the proper mastication of wholesome food, and its reception into the stomach. Not only must the food be wholesome, but a proper quantity, and no more, must be taken, and that at proper intervals. After its reception into the stomach a certain amount of attention to the requirements of the act of digestion is necessary for its normal performance. Too violent exercise immediately after, or the swallowing of too much fluid, particularly of cold water, will interfere with digestion and render it more or less imperfect. The system must be free from poisonous or malarious influences, and the mind unoccupied with distressing thoughts. As soon as digestion has progressed to some extent, and absorption of digested material has taken place, and consequently assimilation commenced, a certain amount of motion among the organs and tissues of the various parts of the body should be going on, so that the fluids which carry the nutritive materials may be sent on in their channels and thrown and drawn into the tissues they are destined to supply. This motion is principally produced by the exercises given by the ordinary duties of life, but those duties are so variously distributed among different persons that some get a great deal too much exercise, and others do not get near enough. In neither of these classes, therefore, can nutrition be perfectly normal. It is true that the tissues of the body are endowed with abundant, it may be said naturally superabundant, vitality, or restorative power, by which abnormal tendencies are overcome, except when they are too great. Then a certain degree of unhealthy nutrition will follow, and this is the general rule. There are few persons, especially in large cities whose inhabitants are so unfortunate as to be unable to secure sanitary policing of their neighborhoods, whose solids and fluids are not more or less impregnated with malarial poisons. The processes of nutrition in them require much more assistance than in those who live in more cleanly towns. Often some of the organs get into a condition far below the natural standard, and are composed of more or less degenerated tissue. This does not have the normal assimilative power and cannot derive from the blood, which itself is necessarily more or less abnormal, constituents for healthy regeneration. Under such circumstances various means require to be resorted to to assist the weakened tissues and forces. Medicines are often given, sometimes with a view of antagonizing certain of the malarial symptoms, of stimulating the nervous system to action, and of promoting excretion; often quinine is administered with benefit, it sometimes being the only available remedy unless the person removes to where the air is pure. But it is a sound axiom in medicine that recovery from disease is "regeneration

of tissue." The real remedy for most cases of faulty nutrition, and which are included in the various forms of disease, is diet, and, when it can be had, exercise. But in many cases of sickness voluntary exercise is out of the question, and rest, as nearly absolute as possible, is demanded. In nearly all cases, however, of chronic disease, exercise, both voluntary and passive, is the only rational treatment having as its end complete recovery, or in other words, return to healthy nutrition. And all the exercise required in most cases of debility is not secured by mere movements of the limbs. The motion which is imparted by friction of various kinds, and by kneading the body so thoroughly that internal parts have their surfaces moved over each other, and alternations of pressure exerted so that the contents of the different vessels are propelled in their natural directions, is of very great advantage, and supplies a natural stimulus to the nerves, which regulate to a certain extent the nutritive forces.

It must be apparent that as the blood is the great carrier of nutritive material to all parts of the body, it is of the highest importance that it should be in a perfectly healthy condition, and this implies that all the secreting and excreting glands shall take from it all that it has borne away of effete matter from parts through which it has passed, and further elaborate all that is retained. But that these organs shall be able to do this, the blood itself must furnish them with the proper materials. There is therefore an intimate interdependence between the blood and every organ, and also between each organ and every other. The blood must have its normal quantity of fibrin (q.v.), of hemoglobine (q.v.), of iron, and of alkaline salts. If these are deficient, or any one of them, they must be supplied either in the food or in the form of medicine. Of great importance to nutrition are the lymphatic glands and the lymphatic system of vessels. (See LYMPH and LYMPHATICS, *ante*.) The liver (q.v.), the most important gland in all the body, if poisoned by malaria, or otherwise, can neither perform its biliary nor its glycogenic functions, nor can the cholesterine, which has been brought to it as a product of nerve disassimilation, be properly separated from the blood or combined with the bile. The ductless glands exercise important offices in the elaboration of the blood. It has not been precisely determined what they do, or all that they do, but the spleen (q.v.) probably acts a part in renovating blood corpuscles, and is a sort of store-house of nutritive material. One of the quite constant effects of a miasm upon the human system is enlargement of the spleen. Thus we see an example in this single organ of the disturbing influences of malarial poison upon nutrition. The evolution of vital force is generally spoken of as the great purpose of nutrition, but perhaps it would be more comprehensive to say that the great purpose is the reparation of the organism and the keeping it in a normal condition that it may be the instrument for the transmission of force. See DIET and FOOD AND DRINK, *ante*.

NUTTALL, THOMAS, 1786–1859, b. England; apprenticed to a printer, but came to the United States and devoted himself to the study of natural history. He made a scientific exploration of the great lakes and the n. tributaries of the Mississippi. In 1810 he went up the Missouri to the Mandan villages, and in 1819 he traveled through the country drained by the Arkansas river. He published an account of his journey in 1821, under the title of *A Journal of Travels into the Arkansas Territory*. He also explored the Pacific coast, upon the natural history of which he published a number of papers. In 1822 he became professor of natural history and curator of the botanic garden at Harvard college. His most important books are *A Manual of the Ornithology of the United States and Canada*, 1834, and *The North American Sylva*, 1842–49. He left his professorship in 1834, and finally settled in England, where an estate had been given him on condition of his living on it.

NUX VOMICA is the pharmacopœial name of the seed of *strychnos nux vomica*, or *poison nut*. The following are the characters of these seeds, which are imported from the East Indies: "Nearly circular and flat, about an inch in diameter, umbilicated and slightly convex on one side, externally of an ash-gray color, thickly covered with short satiny hairs, internally translucent, tough, and horny, taste intensely bitter, inodorous."—*The British Pharmacopœia*, p. 99.

For the genuine characters, see the article STRYCHNOS. The nux vomica tree is a native Coromandel, Ceylon, and other parts of the East Indies. It is a tree of moderate size, with roundish-oblong, stalked, smooth leaves, and terminal corymbs. The fruit is a globular berry, about as large as a small orange, one-celled, with a brittle shell, and several seeds lodged in a white gelatinous pulp. The bark is known as *false angostura bark*, having been confounded with angostura bark, in consequence of a commercial fraud, about the beginning of the present c.; but its properties are very different, as it is very poisonous.

The seeds contain (in addition to inert matters, such as gum, starch, woody fiber, etc.) three alkaloids closely related to each other, which act as powerful poisons on the animal frame, and speedily occasion violent tetanic convulsions and death. These alkaloids or bases are named *strychnia*, *brucia*, and *igasuria*, and exist in the seeds in combination with lactic and strychnic (or igasuric) acid. For a good method of obtaining pure strychnia, which is by far the most important of the three bases, the reader is referred to p. 328 of *The British Pharmacopœia*.

Strychnia ($C_{42}H_{22}N_2O_4$) occurs "in right square octahedrons or prisms, colorless and

inodorous, scarcely soluble in water, but easily soluble in boiling rectified spirit, in ether, and in chloroform. Pure sulphuric acid forms with it a colorless solution, which, on the addition of bichromate of potash, acquires an intensely violet hue, speedily passing through red to yellow."—*Op. cit.* In nitric acid, it ought, if pure, to form a colorless solution; if the solution is reddish, it is a sign that brucia is also present. Strychnia combines with numerous acids, and forms well-marked salts, which are amenable to the same tests as the base itself.

Brucia ($C_{46}H_{26}N_2O_8 + 8$ Aq) is insoluble in ether, but more soluble in water and in strong alcohol than strychnia; and it is the most abundant of the three alkaloids in nux vomica. It acts on the animal economy similarly to but much less actively than strychnia, from which it may be distinguished not only by its different solubility, but by the red color which is imparted to it by nitric acid, and which changes to a fine violet on the addition of protochloride of tin. Like strychnia, it forms numerous salts.

Igasuria seems closely to resemble brucia in most respects. Little is known regarding *igasuric acid.*

Strychnia, brucia, and igasuria, occur not only in nux vomica, but in the seeds of *strychnos ignatii* (St. Ignatius's beans), and in the seeds and other parts of several plants of the genus *strychnos.* The amount of strychnia present in these substances varies from 0.5 to 1.5 per cent.

Nux vomica, according to the experiments of Marcet, acts on vegetables as a poison. His experiments were, however, confined to the haricot bean and the lilac. It is poisonous in a greater or lesser degree to most animals, though larger quantities are required to kill herbivorous than carnivorous animals. Thus, a few grains will kill a dog, but some ounces are required to destroy a horse. It is believed, however, that the bird called *buceros rhinoceros* eats the nuts with impunity; and a peculiar kind of *acarus* lives and thrives in the extract of the nuts. Dr. Pereira describes three degrees of the operation of this substance on man. 1. In very small doses, its effects are tonic and diuretic, and often slightly aperient. 2. In larger doses, there is a disordered state of the muscular system; the limbs tremble; a slight rigidity or stiffness is felt when an attempt is made to put the muscles in action; and the patient experiences a difficulty in keeping the erect posture. If the use of the medicine be continued, these effects increase in intensity, and the voluntary muscles are thrown into a convulsed state by very slight causes, as, for example, by inspiring more deeply than usual, or even by turning in bed. It is remarkable that in paralysis the effects are most marked in the paralyzed parts. 3. In poisoning doses, the symptoms are tetanus and asphyxia, followed by death. After swallowing a large dose of strychnia (on which the poisonous effects of nux vomica essentially depend), the following phenomena occurred in a case recorded by Taylor in his *Medical Jurisprudence:* "A young man, aged seventeen, swallowed forty grains of strychnia. The symptoms came on in about a quarter of a hour; lock-jaw and spasmodic contraction of all the muscles speedily set in, the whole body becoming as stiff as a board; the lower extremities were extended and stiff, and the soles of the feet concave. The skin became livid, the eyeballs prominent, and the pupils dilated and insensible; the patient lay for a few minutes without consciousness, and in a state of universal tetanus. A remission occurred, but the symptoms became aggravated, and the patient died asphyxiated from the spasm of the chest in about an hour and a half after taking the poison." It is difficult to say what is the smallest dose that would prove fatal to an adult. Thirty grains of the powdered nuts, given by mistake to a patient, destroyed life. Three grains of the extract have proved fatal; and in a case quoted by Taylor (*op. cit.*), half a grain of sulphate of strychnia caused death in 14 minutes.

The preparations of nux vomica are the powdered nuts, the extracts, the tincture, and strychnia; the alkaloid being usually preferable, in consequence of its more constant strength. In various forms of paralysis, especially where there is no apparent lesion of structure, nux vomica is a most successful remedy; although there are cases in which it is positively injurious. It is also of service in various affections of the stomach, such as dyspepsia, gastrodynia, and pyrosis. The average dose of the powder is two or three grains, gradually increased; that of the tincture, 10 or 15 minims; and that of the extract half a grain, gradually increased to two or three grains. The dose of strychnia, when given in cases of paralysis, is at the commencement one-twentieth of a grain three times a day, the dose being gradually increased, till slight muscular twitchings are observed. For gastric disorders, a still smaller dose is usually sufficient, as, for example, one-fortieth of a grain.

NYACK, a village in Rockland co., N. Y., on the Hudson river, 28 m. n. of New York, on the Northern railroad of New Jersey; pop. '80, 3,881. It is connected with New York city by steamboat, and with Tarrytown by ferry. It has churches, a female seminary, two newspapers, a number of summer hotels, a national bank, etc.

NYAM-NYAM, a tribe of negroes in n. central Africa, s. of the country of Bongos, between 4° and 6° n. lat. and 24° and 29° e. long. Schweinfurth, who visited their country in 1870, describes them as cannibals, living in cone-shaped straw huts, and possessing some skill in the manufacture of iron and earthen wares. The number of their chiefs is large, and their authority almost absolute, but in every village there is a public place for the consideration and decision of public questions. They are thought by Schwein-

furth to have made a conquest of their present territory within a quite recent period. Though cannibals, they are more civilized than the surrounding tribes.

NYAN'ZA, VICTORIA, a great fresh-water lake in central Africa, discovered by capt. Speke in 1858, explored by Speke and Grant in 1862. The most authentic information that we have about the Victoria Nyanza is, however, derived from the exploration and circumnavigation of it by Stanley in 1875. The native name, Nyanza, signifies "the water." Its southern point is in lat. 2° 44′ s., long. 33° east. Its northern shore runs nearly parallel to the equator, and is about 20 m. to the n. of it. It is estimated to be about 220 m. in length, and 180 in breadth. It is of no great depth; the surface is about 3,800 ft. above sea-level. There are a number of islands near its shores, the chief of which are Ukerewe in the s.e., and Sasse in the north-west. At its n.e. extremity, lake Baringo, described by the natives as a long narrow basin, seems to be connected with the Victoria Nyanza by a narrow channel. The countries on the w. shores of the lake enjoy a mild and genial climate, and the rainfall is below that of many parts of Britain, being only 49 inches. M'tesa, king of Uganda, seems to be the most powerful monarch on the shores of the lake, his sway extending over a large portion of the northern and western coasts. His subjects possess a considerable degree of civilization. The most considerable tributary of the Victoria Nyanza is the Shimiyu (see NILE), which flows into its southern extremity in long. 33° 33′ east. The Nile emerges from the n. end of the Victoria Nyanza at Napoleon bay, precipitating itself over the Ripon falls. North-west from lake Nyanza lies what Speke called Lúta N'Zigé lake, which was described as a narrow reservoir about 230 m. long, through the northern end of which the Nile passes. This lake is now known as the Albert Nyanza (q.v.).

NYAN'ZA (*ante*). See AFRICA.

NYAS'SA, or NYANJA (apparently identical with name N'yanza), another lake in the interior of Africa, which Dr. Livingstone discovered in 1861 by ascending the river Shiré (q.v.). The southern end of the Nyassa, or Star Lake, is in lat. 14° 25′ s., and its northern end extends to the parallel of 9° 20′ south. The lake is upwards of 300 m. long, its average breadth being 26, and is 1300 ft. above sea-level. The first representatives of a mission on Nyassa, founded in honor of Dr. Livingstone, carried with them in sections a steamer of steel plates, which was successfully launched on the lake in 1875. None of the rivers flowing into Nyassa are navigable. The lake is in most parts very deep—in many places over 100 fathoms. To the east is a range of mountains 100 miles long, and ranging from 10,000 to 12,000 ft. over the lake. The scenery of Nyassa is described as grand in the extreme, though much of the land surrounding it is low and marshy. The population of its shores, once dense, has been sorely scourged by the slave-trade. Something had previously been known about this lake under the name of the Maravi; but the accounts were so vague that latterly it was omitted from the maps of Africa.

NYÂYA (from the Sanskrit *ni*, into, and *âya*, going, a derivative from *i*, to go; hence, literally, "entering," and, figuratively, "investigating analytically") is the name of the second of the three great systems of ancient Hindu philosophy; and it is apparently so called because it treats analytically, as it were, of the objects of human knowledge, both material and spiritual, distributed by it under different heads or topics; unlike, therefore, the *vedânta* (q.v.) and *sânkhya* (q.v.), which follow a synthetic method of reasoning, the former of these systems being chiefly concerned in spiritual and divine matters, and the latter in subjects relating to the material world and man. The Nyâya consists, like the two other great systems of Hindu philosophy (see MÎMÂNSÂ and SÂNKHYA), of two divisions. The former is called NYÂYA (proper), and will be exclusively considered in this article; the other is known under the name of VAIS'ESHIKA (q.v.). With the other systems or philosophy, it concurs in promising beatitude—that is, final deliverance of the soul from re-birth or transmigration—to those who acquire truth, which, in the case of the Nyâya, means a thorough knowledge of the principles taught by this particular system.

The topics treated of by the Nyâya are briefly the following: 1. The *pramân'a*, or instruments of right notion. They are: *a.* Knowledge which has arisen from the contact of a sense with its object; *b.* Inference of three sorts (*à priori*, *à posteriori*, and from analogy); *c.* Comparison; and *d.* Knowledge, verbally communicated, which may be knowledge of "that whereof the matter is seen," and knowledge of "that whereof the matter is unseen" (revelation). 2. The objects or matters about which the inquiry is concerned (*prameya*). They are: *a.* The *Soul* (*âtman*). It is the site of knowledge or sentiment, different for each individual coexistent person, infinite, eternal, etc. Souls are therefore numerous, but the supreme soul is one; it is demonstrated as the creator of all things. *b. Body* (*s'arîra*). It is the site of action, of the organs of sensation, and of the sentiments of pain or pleasure. It is composed of parts, a framed substance, not inchoative, and not consisting of the three elements, earth, water, and fire, as some say, nor of four or all the five elements (viz. air and ether in addition to the former), as others maintain, but merely earthy. *c. Organs of sensation* (*indriya*); from the elements, earth, water, light, air, and ether, they are smell, taste, sight, touch, and hearing. *d. Their objects* (*artha*). They are the qualities of earth, etc.—viz. odor, savor, color, tangibility, and sound. *e. Understanding* (*buddhi*), or *apprehension* (*upalabdhi*), or

conception (*jnâna*), terms which are used synonymously. It is not eternal, as the Sânkhya maintains, but transitory. *f. The organ of imagination and volition* (*manas*). Its property is the not giving rise simultaneously to more notions than one. *g. Activity* (*pravr'itti*), or that which originates the utterances of the voice, the cognitions of the understanding, and the gestures of the body. It is therefore oral, mental, or corporeal, and the reason of all worldly proceedings. *h. Faults* or *failings* (*dosha*), which cause activity—viz. affection, aversion, and bewilderment. *i. Transmigration* (*pretyabhâva*, literally, the becoming born after having died), or the regeneration of the soul, which commences with one's first birth, and ends only with final emancipation. It does not belong to the body, because the latter is different in successive births, but to the soul, because it is eternal. *k. Fruit* or *retribution* (*phala*), or that which accrues from activity and failings. It is the consciousness of pleasure or of pain. *l. Pain* (*duh'kha*), or that which has the characteristic mark of causing vexation. It is defined as "the occurrence of birth," or the originating of "body," since body is associated with various kinds of distress. Pleasure is not denied to exist, but, according to the Nyâya, it deserves little consideration, since it is ever closely connected with pain. *m. Absolute deliverance* or *emancipation* (*apavarga*). It is annihilation of pain, or absolute cessation of one's troubles once for all.

After (1) "instruments of right notion," and (2) "the objects of inquiry," the Nyâya proceeds to the investigation of the following topics.

3. *Doubt* (*sam's'aya*). It arises from unsteadiness in the recognition or non-recognition of some mark, which, if we were sure of its presence or absence, would determine the subject to be so or so, or not to be so or so; but it may also arise from conflicting testimony. 4. *Motive* (*prayojana*), or that by which a person is moved to action. 5. *A familiar case* (*dr'ish'tânta*), or that in regard to which a man of an ordinary and a man of a superior intellect entertain the same opinion. 6. *Tenet* or *dogma* (*siddhânta*). It is either "a tenet of all schools," i.e., universally acknowledged, or "a tenet peculiar to some school," i.e., partially acknowledged; or "a hypothetical dogma," i.e., one which rests on the supposed truth of another dogma; or "an implied dogma," i.e., one the correctness of which is not expressly proved, but tacitly admitted by the Nyâya. 7. The different members (*avayava*) of a regular argument or *syllogism* (*nyâya*). 8. *Confutation* or reduction to absurdity (*tarka*). It consists in directing a person who does not apprehend the force of the argument as first presented to him, to look at it from an opposite point of view. 9. *Ascertainment* (*nirn'aya.*) It is the determination of a question by hearing both what is to be said for and against it, after having been in doubt. The three next topics relate to the topic of controversy, viz. 10. *Discussion* (*vâda*), which is defined as consisting in the defending by proofs on the part of the one disputant, and the controverting it by objections on the part of the other, without discordance in respect of the principles on which the conclusion is to depend; it is, in short, an honest sort of discussion, such, for instance, as takes place between a preceptor and his pupil, and where the debate is conducted without ambition of victory. 11. *Wrangling* (*jalpa*), consisting in the defense or attack of a proposition by means of tricks, futilities, and such like means; it is therefore a kind of discussion where the disputants are merely desirous of victory, instead of being desirous of truth. 12. *Caviling* (*vitan'd'á*), when a man does not attempt to establish the opposite side of the question, but confines himself to carping disingenuously at the arguments of the other party. 13. *Fallacies*, or semblances of reasons (*hetvâbhâsa*), five sorts of which are distinguished, viz. the erratic, the contradictory, the equally available on both sides, that which, standing itself in the need of proof, does not differ from that which is to be proved, and that which is adduced when the time is not that when it might have availed. 14. *Tricks*, or unfairness in disputation (*chhala*), or the opposing of a proposition by means of assuming a different sense from that which the objector well knows the propounder intended to convey by his terms. It is distinguished as verbal misconstruing of what is ambiguous, as perverting, in a literal sense, what is said in a metaphorical one, and as generalizing what is particular. 15. *Futile objections* (*jâti*), of which twenty-four sorts are enumerated; and, 16. Failure in argument or reason of defeat (*nigraha-sthâna*), of which twenty-two distinctions are specified.

The great prominence given by the Nyâya to the *method*, by means of which truth might be ascertained, has sometimes misled European writers into the belief, that it is merely a system of formal logic, not engaged in metaphysical investigations. But though the foregoing enumeration of the topics treated by it could only touch upon the main points which form the subject-matter of the Nyâya, it will sufficiently show that the Nyâya intended to be a complete system of philosophical investigation; and some questions, such as the nature of intellect, articulated sound, etc., or those of genus, variety, and individual, it has dealt with in a masterly manner, well deserving the notice of western speculation. That the atomistic theory has been devolved from it, will be seen under the article VAIS'ESHIKA. On account of the prominent position, however, which the *method* of discussion holds in this system, and the frequent allusions made by European writers to a Hindu syllogism, it will be expedient to explain how the Nyâya defines the "different members of a syllogism" under its seventh topic. A regular argument consists, according to it, of five members—viz. *a.* the proposition (*pratijnâ*), or the declaration of what is to be established; *b.* the reason (*hetu*), or "the means for the establishing of what is to be established;" *c.* the *example* (*udâharan'a*), i.e. some familiar case illustrating the fact to be established, or, inversely, some familiar case illustrating

the impossibility of the contrary fact; *d.* the application (*upanaya*), or "restatement of that in respect of which something is to be established;" and *e.* the conclusion (*nigamana*), or "the re-stating of the proposition because of the mention of the reason." An instance of such a syllogism would run accordingly thus: *a.* This hill is fiery, *b.* for it smokes, *c.* as a culinary hearth, or (inversely) not as a lake, from which vapor is seen arising, vapor not being smoke, because a lake is invariably devoid of fire; *d.* accordingly, the hill is smoking; *e.* therefore, it is fiery.

The founder of the Nyâya system is reputed under the name of *Gotama*, or, as it also occurs, *Gautama* (which would mean a descendant of Gotama). There is, however, nothing as yet known as to the history of this personage or the time when he lived, though it is probable that the work attributed to him is, in its present shape, later than the work of the great grammarian Pân'ini. It consists of five books or *Adhyâyas*, each divided into two "days," or diurnal lessons, which are again subdivided into sections or topics, each of which contains several aphorisms, or *Sûtras*. See SÛTRA. Like the text-books of other sciences among the Hindus, it has been explained or annotated by a triple set of commentaries, which, in their turn, have become the source of more popular or elementary treatises.—The Sanskrit text of the Sûtras of Gotama, with a commentary by *Vis'wanâtha*, has been edited at Calcutta (1828); and the first four books, and part of the fifth, of the text, with an English version, an English commentary, and extracts from the Sanskrit commentary of Vis'wanâtha, by the late Dr. J. R. Ballantyne (Allahabad, 1850–54). This excellent English version and commentary, and the celebrated Essay on the Nyâya, by H. T. Colebrooke (*Transactions of the Royal Asiatic society*, vol. i. Lond. 1827; and reprinted in the *Miscellaneous Essays*, vol. i. Lond. 1837), are the best guide for the European student who, without a knowledge of Sanskrit, would wish to familiarize himself with the Nyâya system.

NYBORG, a t. in Denmark, 16 m. s.e. of the city of Odense on the e. coast of Fünen, an island of the Baltic; pop. about 4,500. It is fortified, has a strong citadel, and here the Sound dues were paid by passing ships before the exclusive right of Denmark to the entrance of the Baltic was extinguished by purchase. The place contains ruins of the ancient palace of the kings of Denmark, a hospital, infirmary and dockyards. Near the walls occurred, in 1659, the great victory of the Danes over the Swedes.

NYCTAGINA'CEÆ, a natural order of exogenous plants, consisting partly of herbaceous plants, both annual and perennial, and partly of shrubs and trees. Lindley ranks them in his *Chenapodal alliance*. The flowers are either clustered or solitary, and either the cluster or the flower often has an involucre, which is often gayly colored. The perianth is tubular, plaited in bud, colored; the limb entire or toothed, deciduous. The stamens are equal in number to the lobes of the perianth. The ovary is superior, with one ovule, and one style. The fruit is a thin *caryopsis*, inclosed within the enlarged and indurated base of the perianth. There are about 100 known species, natives of warm countries. Some have flowers of considerable beauty, as those of the genus *mirabilis*, known in our gardens as *Marvel of Peru*, one of which, *M. Jalapa*, was at one time erroneously supposed to produce jalap. The roots of many are fleshy, purgative, and emetic. Those of *Boerhaavia paniculata* are used instead of ipecacuanha both in Guiana and in Java.

NYCTALO'PIA AND HEMERALOPIA. Terms employed for affections of the eye, and which have been indiscriminately employed. Mr. Lawrence, an English surgeon, and one of the pioneers in scientific ophthalmology, says "A great confusion has arisen in the application of these learned terms, each word being nearly as often used to express one affection as the other. Hippocrates used the term hemeralopia to denote night-blindness, and we may as well follow his example." And this is good etymology, for nyctalopia signifies "I see by night," while hemeralopia signifies "I see by day." Still it is not uncommon for nyctalopia to be defined as "night-blindness." "Hemeralopia," says Mr. Lawrence, "is that state of vision in which the patient sees well during the day, but imperfectly as twilight comes on; and when the affection is fully formed he loses his sight entirely at the approach of night, not being able to see a lighted candle brought close to the eye. In the commencement of the affection the person can see by moonlight, or when the room is lighted by a candle, but as it proceeds he can discern nothing after sunset; in the morning vision returns. There is no unnatural appearance in the eye; indeed if a person can see perfectly during the day, the organ can have undergone no important change (structural). There is little increased irritability in the commencement, but as the affection proceeds the pupil becomes rather dilated. The duration of the disease varies from one night to six or twelve months, or even longer. More generally it lasts from two weeks to three or six months, when left to itself. Relapses are frequent so long as persons remain exposed to the exciting cause, which seems to be the exhaustion of the power of the retina by exposure to strong light during the day." The disease is most prevalent in hot climates, and where there is much glare of sunlight, as in the East and West Indies. It is not also infrequent in high latitudes where the snow reflects the sun's rays for a great many hours during the day. Dr. Matthew Guthrie states that peasants in the interior of Russia are subject to it, where it is called *Kïeritsha slepotæ*, or hen blindness, and occurs during the harvest in June and July. He also says that several hundred Russian soldiers in the war in Finland were attacked by the affection. It has been recorded as occurring epidemically, and an instance is related in the 8th vol. of

the *Dublin Journal* of medical and chemical science of such an epidemic among some Prussian soldiers stationed on the Rhine; but Mr. Lawrence observes that all the cases which he had seen commenced in the East or West Indies and were brought to England. Mackenzie, another high British authority, says that the disease does not appear to be necessarily connected by any constitutional symptoms, and Mr. Bampfield, in the *British Medico-chirurgical Transactions*, states that of more than three hundred cases in his practice in different parts of the globe, but chiefly in the East Indies, all perfectly recovered. The prognosis is, therefore, very favorable. In some instances night-blindness, or hemeralopia, is congenital. Richter relates three cases in a family of nine children. The only abnormal appearance of the eyes was the excessive dilation of the pupils after sundown. When the account was given these children had reached the age of from 20 to 30 years, without any alteration in their sight. One of them had never seen any stars. Dr. Cunier, of Ghent, relates some remarkable cases of hereditary hemeralopia (*Annales de la société de médecine de Gand* 1840). In the official capacity of an army surgeon, in the case of a conscript claiming exemption from night-blindness, Dr. Cunier made an examination in the commune of Vendémain, near Montpellier, and reported upon information and observation that one Jean Nougaret was the first of the family known to be hemeralopic; his children, one daughter, and two sons, were all affected with night-blindness. The second generation included 16 individuals of whom ten were thus affected; in the third generation there were 14 out of 81; in the fourth 23 in 208; in the fifth, not then completed, 24 in 218; in the sixth, including 103 persons, there were 11. But one of the remarkable facts in the case, and worthy of much consideration by those studying the subject of heredity, because varying in this respect from most hereditary laws, is that among all these descendants, numbering more than 600, and of whom nearly one-seventh were affected with night-blindness, there was not a single case in those families where both parents were free from the affection; that is, there was no intermediate transmisssion. *Nyctalopia*, or "night-seeing" (day-blindness) is a state opposite to hemeralopia, and is a disease of a very different nature. Mr. Lawrence states that in opacity of the cornia, in certain forms of cataract, in incipient opacity of the lens, in central opacity of the capsule, in contractions of the pupil from prolapse of the iris, the patient will often see best in a weak light, and find vision very imperfect in a strong light. In scrofulous affections of the eyes (strumous ophthalmia) the intolerance to light amounts to blindness during the day, while in the evening, with a faint light the patient sees quite well. Albinos are frequently nyctalopic, the absence of pigmentum nigrum, rendering the eye extremely sensitive, from its want of absorptive power. Barron Larrey records a remarkable case of day blindness, occurring in an old man, one of the galley slaves at Brest, who had been shut up in a subterranean dungeon 33 years. He had become so affected that he could only see in a shady light. As this condition is generally accompanied with some observable affection of the ocular apparatus its treatment will vary with circumstances.

NYCTERIBIA, an extremely curious genus of insects, ranked in the order *diptera*, although very different from most of that order, and having neither wings nor balancers. Its nearest alliance is with *hippoboscidæ* (See Forest Fly and Sheep Tick), which it resembles particularly in parasitic habits, and in the retention of the eggs within the abdomen of the female, until they have not only been hatched, but have passed from the larva into the pupa state. The form, however, is so spider-like, that these insects were at first ranked among the *arachnida*. The few species known are all parasitic on bats, on which they run about with great activity. The head is very small, curiously affixed to the back of the thorax, and when the creature sucks the blood of the bat, upon which it lives, it places itself in a reversed position.

NYCTICEBINÆ, a sub-family of lemuroid monkeys. They are distinguished from the rest of the family by their very short tails. There are two African and two Asiatic genera. The African genera are *perodicticus*, or the potto, and *arctocebus*, or the angwantibo. The Asiatic genera are the slender lemur (*loris*), and the slow lemur (*nycticebus*). In all these four genera the fore-finger of each hand is short, and in the potto it is rudimentary, so that each hand has but three fingers. They are inactive during the day, but at night prowl stealthily among the branches in search of food, which consists principally of insects and small birds. They also eat eggs and fruit. When irritated during their period of repose in the day their motions are very slow, and they utter a cry similar to that of the American sloths. They have a very tenacious grasp, ascribed by some to a peculiar mechanical arrangement of the muscles and tendons by which the mere stretching of the leg causes the toes to flex and produce a tight grasp. Others attribute it to the power of continuing muscular contraction, and this idea seems to be strengthened by the observations of sir Anthony Carlisle, who injected the arterial system of a *nycticebus tardigradus* and found a very peculiar and abundant distribution of blood vessels to the limbs. The axillary artery divided into 23 equal-sized cylinders, surrounding the principal trunk, and passing down the arm, each cylinder was found distributed to an individual muscle in the fore-arm. A similar distribution takes place in the lower or hind limbs. In this species there is also a remarkable peculiarity in the tongue, which is double. Beneath the principle tongue, which somewhat resembles a cat's, there is another tongue, white colored, narrow, and very sharp pointed, which is used with the

upper tongue in catching flies and in eating, but which the animal has the power of retaining in the mouth while the other tongue is in use. Dental formula $i\frac{2-2}{2-2}$; $c\frac{1-1}{1-1}$; $pm\frac{3-3}{3-3}$; $m\frac{3-3}{3-3}=36$. The limbs are nearly equal in size, the ears are short and rounded, the eyes large and staring, and placed close together.

NYE, a co. in s.e. Nevada, bounded on the e. by Utah, and on the s.w. by California, drained by Amargoza and Reese rivers, 24,000 sq.m., pop. '80, 1875—66 Chinese. The surface in the n. is made up of mountains and valleys running n. and south. The s. part is mostly elevated sterile table-land, sloping e. to the Colorado river and w. to California. In the valleys there are large tracts of land suitable for grazing and cultivation. The ordinary cereals are raised, and there is considerable live-stock. A rich vein of quartz is found in the mountain ranges, and there are many gold and silver mines. Co. seat, Belmont.

NYE, James W., 1815–76; b. Madison co. N. Y., where he was reared on a farm, received a common school education, studied law and commenced practice. While quite young he was elected district attorney and co. judge. In 1846 he was the anti-slavery candidate for congress in the same district, and defeated. Then he removed to Syracuse. In 1860 he was state police commissioner in the city of New York; was appointed governor of Nevada by president Lincoln in 1861; when Nevada became a state he was elected a U. S. senator from it for six years, ending Mar. 3, 1873. As a public speaker he was distinguished for his contagious humor, and in private for his genial disposition. On his retirement from the senate his mind was impaired. He died at White Plains, N. Y., Dec. 25, 1876.

NYIREGYHAZA, a t. of Hungary, in the co. of Szabolcs, on the railway between Debreczin and Tokay. The trade in agricultural produce is considerable. Nyiregyhaza has salt, soda, and saltpeter works. There are mineral springs in the neighborhood. Pop. '80, 24,102.

NY'KERK, or Nieuwkerk, on the Veluwe, is a very flourishing and well-built t., near the Zuyder Zee, in the province of Gelderland, Netherlands, 25 m. n.w. of Arnheim. Pop. 8,000. It has a good harbor, which is connected with the sea by a wide canal of 1½ m. in length. In the neighborhood are fine rich meadow-pastures and lands suited for all kinds of grain, tobacco, potatoes, etc. Tobacco is extensively grown; many cattle are raised; and a brisk trade carried on both with the surrounding country and Amsterdam, the market to which the cattle, tobacco, dairy, and other agricultural produce, together with much firewood are sent. Nykerk has a handsome Reformed church, a Roman Catholic chapel, a synagogue, orphan-house, and good schools. There are several manufactures carried on, which also give employment to the people. In Netherlands' church history, Nykerk is famed as the place where a great religious movement began at the middle of last century. The history of the movement, which spread throughout the land, contains all the marks of the later revivals in America, Scotland, and Ireland. See Ypey and Dermout's *Geschiedenis der Nederd. Her. Kerk*, vol. iv.

NY'KÖPING, a sea-port of Sweden, pleasantly situated on the Baltic, in lat. 58° 45′ n., long. 17° e., about 60 m. s.w. of Stockholm. It comprises among its manufacturing products cotton goods, stockings, tobacco, etc., and has good ship-yards, mills, and manufactories for machinery, while in the vicinity of the town are extensive paper-mills. The ruined old castle of Nyköping, nearly destroyed by fire in 1665, and which ranked in point of strength next to those of Stockholm and Calmar, has experienced many eventful vicissitudes of fortune. King Valdemar of Sweden, after his dethronement in 1288, was imprisoned here till his death in 1302; but the most tragic incident connected with Nyköping castle was the horrible death within its walls of the dukes Eric and Valdemar, who, after being entrapped by their pusillanimous brother, king Birger, in 1317, were left to perish of hunger in a dungeon, the keys of which the king threw into the sea before he left the castle. The horror of this deed roused the indignation of the people, who seized upon the castle, sacked it, and demolished its keep and donjons. In 1719 the town was taken and dismantled by the Russians; and since then it has ceased to be the scene of any events of historical interest. It is noted for the pure Swedish spoken by its inhabitants. Pop. '80, 4,813.

NYL-GHAU, *Antilope picta*, or *Portax tragocamelus*, a species of antelope, with somewhat ox-like head and body, but with long slender limbs, and of great activity and fleetness. It is one of the largest of antelopes, and is more than four feet high at the shoulder. The horns of the male are about as long as the ears, smooth, black, pointed, slightly curved forwards. The female has no horns. The neck is deep and compressed, not rounded as in most of the antelopes. A slight mane runs along the neck and part of the back, and the breast is adorned with a long hanging tuft of hair. The back is almost elevated into a hump between the shoulders. The Nyl-ghau inhabits the dense forests of India and Persia, where it has long been regarded as one of the noblest kinds of game. It is often taken, like other large animals, by the inclosing of a large space with nets, and by great numbers of people. It is a spirited animal and dangerous to a rash assailant. It is capable of domestication, but is said to manifest an irritable and capricious temper.

NYMPHÆA'CEÆ, a natural order of exogenous plants, growing in lakes, ponds, ditches, and slow rivers, where their fleshy root-stocks are prostrate in the mud at the bottom; and their large, long-stalked, heart-shaped, or peltate leaves float on the surface of the water. Their flowers also either float, or are raised on their stalks a little above the water. The flowers are large, and often very beautiful and fragrant. There are usually four sepals, and numerous petals and stamens, often passing gradually into one another. The ovary is many-celled, with radiating stigmas, and very numerous ovules, and is more or less surrounded by a large fleshy disk. The seeds have a farinaceous albumen. More than fifty species are known, mostly natives of warm and temperate regions. The root-stocks of some of them are used as food, and the seeds of many.—See WATER-LILY, LOTUS, VICTORIA, and EURYALE.—Very nearly allied to Nymphæaceæ are *Nelumbiaceæ.* See NELUMBO.

NYMPHS, in classic mythology, female divinities of inferior rank, inhabiting the sea, streams, groves, meadows and pastures, grottoes, fountains, hills, glens, trees, etc. Among the nymphs, different classes were distinguished, particularly the *Oceanides,* daughters of Oceanus (nymphs of the great ocean which flows around the earth), the *Nereids,* daughters of Nereus (nymphs of the inner depths of the sea, or of the inner sea —the Mediterranean), *Potameides* (river nymphs), *Naiads* (nymphs of fountains, lakes, brooks, wells), *Oreades* (mountain nymphs), *Dryads* or *Hamadryads* (forest nymphs, who were believed to die with the trees in which they dwelt). They were the goddesses of fertilizing moisture, and were represented as taking an interest in the nourishment and growth of infants, and as being addicted to the chase (companions of the divine huntress Diana), to female occupations, and to dancing. They are among the most beautiful conceptions of the plastic and reverent (if credulous) fancy of the ancient Greeks, who, in the various phenomena of nature—the rush of sea-waves, the bubble of brooks, the play of sunbeams, the rustle of leaves, and the silence of caves—felt, with a poetic vividness that our modern science will hardly permit us to realize, the presence of unseen joyous powers.

NYS'SA. See TUPELO.

NYS'TADT, a t. of Finland, on the eastern coast of the gulf of Bothnia, 50 m. s. of Bjorneborg. Here, in 1721, a treaty was agreed to, between Russia and Sweden, by virtue of which all the conquests of Peter the great along the coasts of the gulf of Finland were annexed to Russia. Pop. '80, 3,837.

O

O, THE fifteenth letter in the English and in most western alphabets, is one of the five simple vowel signs of the English language. As the language is at present pronounced, it stands for at least four distinct sounds, heard in the words *note, nōr,* (nŏt), *move, son.* The primary and simple sound of O is that heard long in *nōr,* and short in *nŏt, tŏp.* The sound given to it in such words as *note, go,* is really a diphthong—a long *o* terminating in a slight *u* or *oo* sound (o-u). The corresponding letter in the Hebrew and Phenician alphabet (q.v.) was called Ayn, i.e., "eye;" and accordingly the primitive form of the Phenician letter was a rough picture of an eye, which naturally became a circle with a dot in the center—still to be seen in some ancient inscriptions—and then a simple circle.

O', a prefix in many Irish family names, serves to form a patronymic, like *Mac* in Gaelic names; as O'Brien, a descendant of Brien. By some, it is considered to be derived from *of;* but it is more likely from Ir. *ua,* Gael. *ogha,* a grandson. In the Lowland Scottish the word *oe* is used for grandson, and in some localities for nephew.

OA'HU, one of the Sandwich islands (q.v.).

OAJA'CO, or OAXACA, a Mexican state, bounded s. by the Pacific, e. by Tehuantepec and the gulf of Tehuantepec, w. and n. by Puebla and Vera Cruz; 31,882 sq.m.; pop. not far from 500,000; La Verda is the only river of consequence. The surface is almost entirely made up of mountains and table-lands and the climate is remarkably fine; the rainfall is large, and the heat less oppressive than in most other states of Mexico. The products of the soil are greatly varied; cochineal and indigo are the chief exports, and wheat, coffee, sugar, tobacco, cotton, cocoa, honey, plantains, and fruit of all kinds, are found. Gold and silver mines exist, but are of little importance. The soil is so rich that two crops of wheat and maize are produced annually. The inhabitants are mostly Indians, half-breeds, and mestizoes. The capital, Oaxaca, is beautifully situated in the center of the state.

OAJA'CO, OAXACA, or GUAXACA, a city of Mexico, capital of a state of the same name, stands on the river Rio Verde, 210 m. s.s.e. of Mexico. It covers an area 2 m. in length by 1¼ in breadth, is well built, with open streets, interspersed with plantations, on which the cochineal insect feeds, and has about 25,000 inhabitants. Silk, cotton, sugar, and chocolate are manufactured.

OAK, *Quercus,* a genus of trees and shrubs of the natural order *cupuliferæ,* having a three-celled ovary, and a round (not angular) nut—which is called an *acorn*—placed in

a scaly truncated cup, the lower part of it invested by the cup. The species are very numerous, natives of temperate and tropical countries. A few species are found in Europe. North America produces many; and many are natives of mountainous regions in the torrid zone; some are found at low elevations in the valleys of the Himalaya, some even at the level of the sea in the Malay peninsula and Indian islands. But in the peninsula of India and in Ceylon none are found; and none in tropical Africa, in Australia, or in South America. The oaks have alternate simple leaves, which are entire in some, but in the greater number variously lobed and sinuated or cut; evergreen in some, but more generally deciduous. Many of them are trees of great size, famous for the strength and durability of their timber, as well as for the majesty of their appearance, and their great longevity. Throughout all parts of Europe, except the extreme n., two species are found, or varieties of one species, the Common Oak (*Q. robur*); one (*Q. pedunculata*) having the acorns on longish stalks, the other (*Q. sessiliflora*) having them almost without stalks. Other differences have been pointed out, but they are regarded by some of the most eminent and careful botanists as merely accidental, and not coincident with these; while, as to the length of the fruit-stalks, every intermediate gradation occurs. Both varieties occur in Britain, the first being the most prevalent, as it is generally in the n. of Europe; the second being more abundant in more southern countries. The short-stalked oak is sometimes called Durmast Oak in England. It has been much disputed which is entitled to be considered the true British oak; and much alarm has occasionally been expressed lest new plantations should be made of the wrong kind; whilst the most contradictory statements have been made as to the comparative value and characters of the timber. The oak succeeds best in loamy soils, and especially in those that are somewhat calcareous. It cannot endure stagnant water. It succeeds well on soils too poor for ash or elm; but depends much on the depth of the soil, its roots penetrating more deeply than those of most other trees. Noble specimens of oak trees, and some of them historically celebrated, exist in almost all parts of Britain; but are much more frequent in England than in Scotland. The former existence of great oak forests is attested by the huge trunks often found in bogs. The oak attains a height of from 50 to 100 or even 150 or 180 ft.; the trunk being 4, 6, or even 8 ft. in diameter. It sometimes grows tall and stately, but often rather exhibits great thickness of bole and magnitude of branches. It reaches its greatest magnitude in periods varying from 120 to 400 years, but lives to the age of 600, or even 1000. The timber is very solid, durable, peculiarly unsusceptible of the influence of moisture, and, therefore, eminently adapted for ship-building. It is also employed in carpentry, mill-work, etc.—The bark abounds in tannin; it also contains a peculiar bitter principle called *quercine*, and is used in medicine, chiefly in gargles, etc., on account of its astringency, sometimes also as a tonic; it is used along with gall-nuts in the manufacture of ink; but most of all for tanning (see Bark), and on this account the oak is often planted as copse-wood (see Copse) in situations where it cannot be expected to attain to great size as a tree. The timber of copse oak is excellent fire-wood. The oak is particularly fitted for copse-wood, by the readiness with which it springs again from the stools after it has been cut. Acorns are very nourishing food for swine, and in times of scarcity have been often used for human food, as, indeed, they commonly are in some very poor countries, either alone or mixed with meal. The bitterness which makes them disagreeable is said to be in part removed by burying them for a time in the earth. The acorns of some trees are also much less bitter than others, and oaks of the common species occur which produce acorns as sweet as chestnuts. Other varieties of the common oak are assiduously propagated by nurserymen as curious and ornamental, particularly one with pendulous branchlets (the *weeping oak*), and one with branches growing up close to the stem, as in some kinds of poplar. Among the Greeks and Romans the oak was sacred to Zeus or Jupiter; and it has been connected with the religious observances of many nations, as of the ancient Celts and Germans.—The Turkey Oak or Adriatic Oak (*Q. cerris*), now very frequently planted in Britain, is a large and valuable tree, very common in the s.e. of Europe, and in some parts of Asia. The timber is imported in considerable quantity into Britain for ship-building and other purposes. The leaves differ from those of the common oak in their acute lobes, and the cups of the acorns are *mossy*, i.e., have long, loose, acute scales. Similar to this, in both these respects, are the Austrian Oak (*Q. Austriaca*), abundant near Vienna, and the Spanish Oak (*Q. Hispanica*).—The Cork Oak or Cork-Tree (*Q. suber*) is noticed in the article Cork; the Holm Oak or Evergreen Oak (*Q. ilex*), another of the species found in the s. of Europe, in the article Ilex. Of the North American oaks, some are very valuable as timber trees. Perhaps the most important is the White Oak or Quebec Oak (*Q. alba*), a large tree, the leaves of which have a few rounded lobes. It is found from the gulf of Mexico to Canada; and in some places forms the chief part of the forest. The timber is less compact than that of the British oak; that of young trees is very elastic.—The Overcup Oak (*Q. lyrata*), a majestic tree, highly esteemed for its timber, and having its acorns almost covered by their globular cup, grows chiefly in lands liable to inundation in the southern states.—The Chestnut-leaved White Oak (*Q. prinus*) is also a much-esteemed timber tree of the southern states.—The Swamp White Oak (*Q. bicolor*), a closely allied species, extends further north.—The Live Oak (*Q. virens*), an evergreen species, with entire leathery leaves, is regarded as a tree of the first importance in the United States, from

the excellence of its timber and its value for ship-building, so that efforts have been made by the government to protect it and to promote the planting of its acorns. Yet it is not a very large tree, being seldom more than 45 ft. in height, with a trunk of 2 ft. in diameter. It grows on the coasts of the gulf of Mexico, and as far north as Virginia. It once abounded on the Sea islands, now so celebrated for their cotton.—The RED OAK (*Q. rubra*), a large tree with sinuated and lobed leaves, the lobes toothed and bristle-pointed, yields great part of the *red oak staves* exported from Canada and the n. of the United States to the West Indies; but *red oak staves* are also produced in the middle and southern states by the SCARLET OAK (*Q. coccinea*), a very similar species, by the BLACK OAK or QUERCITRON OAK (*Q. tinctoria*), another species with the lobes of the leaves bristle-pointed, better-known for the dye-stuff which its bark yields (see QUERCITRON), and by the willow oak (*Q. phellos*), a large tree with lanceolate leaves and a willow-like aspect. The timber of all these species is of very inferior quality. These are the American oaks of greatest economical and commercial importance, but there are numerous other species, some of them trees, some mere shrubs, of which some grow on poor soils, and cover them in compact masses; resembling in this a single European species (*Q. viminalis*), a native of the Vosges, 6 to 8 ft. high, with slender, tough branches, which makes excellent hedges.—The BLACK JACK (*Q. nigra*) is an American oak, chiefly notable for the abundance in which it grows on some of the poorest soils. It is a small tree, and its timber of little value. The bark is black.—Some of the Nepaulese oaks are large and valuable trees, as are some of those of China and Japan, of Java, of Mexico, etc. The oaks of Java and the other Indian islands have generally the leaves quite entire.—The bark of most of the species of oak is capable of being used for tanning, and is used in different countries. The cups and acorns of the VALONIA OAK (*Q. ægilops*) are exported from the Morea and other parts of the Levant in great quantities for this purpose, under the name of *valonia*. See LEATHER. The tree resembles the Turkey oak, and has very large hemispherical mossy cups. The cups are said to contain more tannin than any other vegetable substance.—Galls (q.v) or gall-nuts are in great part obtained from the oak, therefore called the GALL-OAK (*Q. infectoria*), a scrubby bush, a native of Asia Minor, with bluntly serrated, ovate-oblong leaves.—The KERMES OAK (*Q. coccifera*), on the leaves of which the kermes (q.v.) insect is found, is a low bush, with evergreen spinous leaves, much resembling a holly, a native of the s.e. of Europe.—Of oaks with sweet and edible acorns, may be mentioned the BALLOTE OAK (*Q. ballota* or *gramuntia*), an evergreen with round spiny-toothed leaves, a native of the n. of Africa, the acorns of which are regularly brought to market in Algeria and in Spain, and are long and cylindrical; the Italian oak (*Q. æsculus*), closely allied to the common oak; and the DWARF CHESTNUT OAK (*Q. chinquapin* or *prinoides*) of North America, a small shrubby species, which has been specially recommended to cultivation on this account. Other North American species, and some of the Himalayan species, also produce edible acorns. From the acorns of some species, oil is made in considerable quantity in different parts of the world, and is used in cookery.—The leaves of the manna oak (*Q. mannifera*)—a native of the mountains of Kurdistan, having oblong, blunt-lobed leaves—secrete in hot weather a kind of manna, a sweet mucilaginous substance, which is made into sweetmeats, and very highly esteemed.

The name oak is sometimes popularly applied to timber trees of very different genera. Thus, AFRICAN OAK is another name of African teak. See TEAK. Some of the species of *casuarina* (q.v.) are called oak in Australia. The STONE OAK (*lithocarpus Javenensis*) of Java, so named from the extreme hardness of its timber, is a tree of the same family with the true oaks.

OAK APPLE. See GALL-FLY; GALLS; *ante.*

OAK BEAUTY, *Biston prodromaria*, a moth of the family *geometridæ*, a native of England, about an inch and a half or two inches in expanse of wings; the upper wings with two brown curved bands, and margined with black, the lower wings with one brown band. The caterpillar feeds on the oak.

OAKES, URIAN, D.D., 1631–81; b. England. He emigrated to Massachusetts in 1634, graduated at Harvard in 1649, and published at Cambridge a set of astronomical calculations while quite young. He accepted a pastorate at Fitchfield, Eng., which his nonconformist views compelled him to relinquish in 1662, and later he preached to another congregation. On account of his learning and piety, he was chosen pastor of the church in Cambridge, whither he returned, commencing his labors in 1671. He accepted the presidency of Harvard college in 1675, being formally installed five years later; and held this position until his death.

OAK'HAM, the county-town of Rutlandshire, Eng., in the vale of Catmos, 25 m. w.n.w. of Peterborough. It is a station on the Syston and Peterborough branch of the Midland railway. In former times, there was a castle here; it is now in ruins with the exception of the portion used as the county-hall. The church, the interior of which was beautifully restored in 1858, is an edifice in the perpendicular style, and has a fine tower and spire. The free grammar school, with an endowment of about £700 a year, was founded in 1581. Pop. (1881) 3,227.

OAKLAND, a co. in s.e. Michigan, drained by the Clinton, and branches of the Huron and Flint rivers; crossed by the Detroit and Milwaukee, and the Flint and Perè

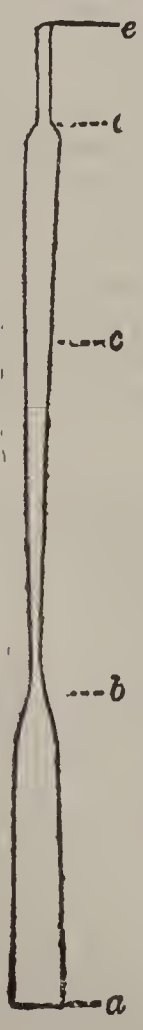
Marquette railroads; 900 sq.m,; pop. '80, 41,537. The surface in the northern portion is undulating, and numerous small lakes diversify it; in most parts the soil is fertile, and in good cultivation; about a quarter of the county is still covered with forests. Wheat, Indian corn, oats, live stock, and butter, are the chief productions; it contains flour mills, carriage, saddlery, plaster and casting manufactories. Co. seat, Pontiac.

OAKLAND, the seat of justice of Alameda co., Cal., on the e. shore of San Francisco bay, terminus of the Central Pacific railroad, 7 m. e. of San Francisco; pop. '80, 34,555. The city takes its name from a grove of majestic evergreen oaks, in which it was first built; but beyond which it now extends. It is a favorite residence for the merchants of San Francisco, and has many drives, fine scenery and a healthy climate. It is governed by a mayor and city council, has a paid fire and police department; is supplied with water from a stream five m. distant, and with gas. San Antonio creek, on the s. front, forms a harbor for the city, but a bar at its mouth obstructs the passage of large vessels at low tide. A pier runs along the w. water front, which is shallow, a distance of 2 m. into the bay; on it are warehouses, three docks, a carriage way, and the rails of the Central Pacific railroad, which connects with the ferry for San Francisco, The city has street railroads, two libraries, graded schools, academies, and educational, benevolent, and horticultural societies; numerous incorporated companies with large capital; manufactories of wind mills and carriages, planing, quartz, and flour mills; cordage and jute factories, the last producing 5,000,000 sacks annually; marble, iron, smelting and metallurgical works; and daily, weekly, and monthly periodicals. There are 2 national banks. It was incorporated as a city in 1854.

OAK'UM, a tangled mass of tarred hempen fibers, is made from old rope by untwisting the strands and rubbing the fibers free from each other. Its principal use is in caulking (q.v.) the seams between planks, the space round rivets, bolts, etc., for the purpose of preventing water from penetrating.

OANNES, the name of a Babylonian god, who, in the first year of the foundation of Babylon, is said to have come out of the Persian gulf, or the old Erythræan sea, adjoining Babylon. He is described as having the head and body of a fish, to which were added a human head and feet under the fish's head and at the tail. He lived amongst men during the day-time, without, however, taking any food, and retired at sunset to the sea, from which he had emerged. Oannes had a human voice, and instructed men in the use of letters, and in all the principal arts and sciences of civilization, which he communicated to them. Such is the account of him preserved by Berosus and Apollodorus. Five such monsters are said to have come out of the Persian gulf; one, called Anedotos or Idotion, in the reign of Amenon, the fourth king of Babylon; another in that of the fifth king; and the last, called Odacon (or Ho Dagon), apparently the Phenician Dagon, under the sixth. Many figures of Oannes, resembling that of a Triton, having the upper part of a man, and the lower part of a fish, or as a man covered with a fish's body, have been found in the sculptures of Kouyonjik and Khorsabad, as well as on many cylinders and gems. Oannes is supposed to have symbolized the conquest of Babylonia by a more civilized nation coming in ships to the mouth of the Euphrates; but he is apparently a water-god, resembling in type and character the Phenician Dagon, and the Greek Proteus and Triton.

Helladius, *Apud Phot. Cod.* 279, pp. 535, 34; Richter, *De Beroso;* Cory. *Anc. Fragm.* p. 30; 1 Sam. v. 4; Bunsen, *Egypt's Place,* vol. 1. p. 705; Layard, *Nineveh,* p. 343.



OAR.

OAR, a wooden instrument by which a person sitting in a boat propels it through the water. The form found in practice to combine greatest power with lightness, is that shown in the figure. From *a* to *b* is the blade of the oar, thin and nearly flat, though occasionally somewhat curved, so as to present a concave surface to the water; from *b* to *d* is round or square, gradually thickening towards *d*, that the part *ce* may nearly balance the part *ac*. At *de* is the handle, which is grasped by one or both hands. The oar rests at *c* on the *row-lock*, and in many cases some device is resorted to to retain the oar from slipping outwards. In the Thames, a leathern stop, called a button, is used; sometimes a pin in the gunwale of the boat passes through the oar (but this weakens the oar, and precludes *feathering*); at other times the oar is fastened to the pin by a leathern thong. The action of an oar in moving a boat is that of a lever, the rower's hand being the power, the water the fulcrum, against which the oar presses, and the row-lock the point at which the opposition caused by the weight of the boat and its cargo is felt, *Feathering* an oar consists in turning it, immediately on leaving the water, so that the flat blade of the oar is horizontal, and in preserving this position until just before the fresh dip, when of course the vertical position must be resumed. Feathering diminishes the resistance offered by air, wind, and small waves; it also adds greatly to the beauty and grace of rowing.

The best oars are of Norway fir, though some are made of ash and beech.

O'ASES, certain cultivated spots in the Libyan desert (called also *Auasis*, *Ouasis*, or *Hoasis*) which produce vegetation, owing to the presence of springs issuing from the

ground. The principal oases are those lying to the w. of Egypt, a few days' journey from the Nile, and known to the ancients by the name of the greater and lesser oases, and that of Ammon. It is supposed that they were known to the Egyptians during the 12th dynasty under the name of *Suten-Khenn*, but no evidence of their occupation by the Egyptians earlier than Darius has been found *in situ*. By some of the ancients they were called the islands of the blessed, or compared to the spots on a panther's skin. Their name is supposed to be the Coptic *Ouahé* (inhabited place). They are first mentioned by Herodotus in his account of the destruction of the army of Cambyses by the storm of sand, or simoom. Equally celebrated is the visit of Alexander the great to the oasis, which he successfully accomplished after the conquest of Egypt, and passed through the desert a nine days' journey before he reached the temple of Ammon, the priests of which declared him the son of that god, and the future conqueror of the entire world. Herodotus describes that of El Wah, or the oasis Magna of the Romans, which contained the oracle of Ammon, and which lies seven days' journey w. of Thebes. It appears to have been anciently frequented by caravans going to the pillars of Hercules. Strabo mentions three oases: the first seven days' journey w. of Abydos; the second, w. of the lake Mœris; the third, near the oracle of Ammon. Pliny mentions two oases; so does Ptolemy, who calls them the lesser and greater. Under the Roman empire, they were used for temporary banishment of criminals of state, and the poet Juvenal was sent there. Olympiodorus, a native of the Thebiad, gives a glowing description of them in the days of Theodosius the younger. Under the Byzantine emperors, the emperors banished there the heads of the Catholic party, at the instigation of the Arians, in the 4th c., and Athanasius himself is supposed to have taken refuge in them. In the 5th c., Nestorius the bishop of Constantinople, was banished there. He was rescued by an excursion of the Blemyes, but expired soon after his arrival at the Nile. The oases were then a place of desolation and horror, occasionally plundered by Bedouins. They fell, 943 A.D., into the power of the Arabs, after having been held by the Egyptian monarchs and their successors till that period; and they are described by Edrisi (1150 A.D.) as uninhabited; by Abulfeda (1240 A.D.) and by Leo Africanus (1513 A.D.), as inhabited and cultivated, and quite independent, having three fortresses. The first modern traveler who visited them is supposed to have been Poncet (1698 A.D.). Subsequently, in 1792, Browne discovered the oasis of Ammon at El Siwah; and it was visited in 1798 by Hornemann, and in 1819 by Cailliaud. It lies in 29° 12′ 20″ n. lat., and 26° 6′ 9″ e. long. Drovetti and Minutoli also visited the same spot.

These oases are now held by Muggrebi Arabs, a powerful race in the desert, capable of raising 30,000 men, who supply camels and guides to travelers. The principal oases are: 1. El Khargeh, or the Oasis Magna, the Greater Oasis of Ptolemy; 2. El Kasr, or Oasis Parva, the Lesser Oasis; 3. Siwah, or the Oasis of Ammon, the most northerly; 4. The Western Oasis, or Dakkel, mentioned by Olympiodorus, and visited by sir Archibald Edmonstone in 1819, and Rohlfs in 1874. Of El Khargeh full particulars have been given by M. Hoskins, who discovered it lying about 125 m. w. of the Nile, having a stream of water rising near the village of Genah, on the north-west of the oasis, and lost in the sand. It is bounded on the e. by Hagel-bel-Badah. North of El Gem lies the metropolis, El Khargeh, which consists of a series of covered streets and open bazaars. The temple lies two hours' journey from it, in a fine situation; the *sekos* has a vestibule of 500 f., with pylons, or gateways, the first of which has a decree in Greek, dated in the reign of Galba (68 A.D.), against forcing persons to farm the revenue, preventing imprisonment for debt, preserving the dowries of women, and limiting the office of strategos for three years. The temple has other decrees preventing the officers of government from smuggling. It has an avenue of sphinxes and three pylons; on the third, Darius is represented offering to Amen Ra, Osiris, and Isis; while Nekht-her-hebi (Nectabes) continued the ornaments of the temple about 414–340 B.C. The sekos is 140 ft. long, and represents Darius offering to Amen Ra, or Khnumis, the ram-head god, and Osiris; while in the accompanying scenes are seen Anta, or Anaitis, Raspu, or Reseph. In the vicinity is a magnificent necropolis of 150 sepulchers, of a late period, with Doric and Corinthian capitals. There are several temples at other spots of the oases. 2. El Kasr, the Oasis Parva, lies four or five days' journey s.e. of Siwah, called the Wah-el-Bahnasa, or Wah-el-Menesheh, contains no monuments older than the Roman, consisting of a triumphal arch, subterraneous and other aqueducts, several hot springs, a necropolis, and Christian church. This oasis was first conquered by the Arabs; and in its vicinity is another oasis called Wady Zerzoora, with others adjoining, of inferior interest. 3. Siwah, or the Oasis of Ammon—one of the first discovered, and repeatedly visited, has, unfortunately, not been seen by any one acquainted with hieroglyphics—lies w. of the Natron lakes. It would appear from Minutoli that the temple was built by Nekht-her-hebi, or Nectabes I., in honor of the god Khnum, Ammon Khnumis or Chnebis, who as the deity of water, presided over the water from which the oasis originated. The oasis is 9 m. long and 2 broad, contains El Garah Gharmy, and Menchyeh, has a population of about 8,000 inhabitants, possesses date and other trees, grows cereals, and has sulphurous springs, a salt lake at Arachieh, and many ruined temples, a necropolis, and other remains. The oracle of Ammon is supposed to have been at a place called Om-Beydah, or the temple of Nekht-her-hebi. From this, it would seem that the oasis did not fall into the power of Egypt till about the 5th c. B.C. The

celebrated Fountain of the Sun is at Siwah Shargieh. It is 30 paces long, 20 broad, six fathoms deep, with bubbles constantly rising to the surface, steaming in the morning, and warmer at night. Close to it are the remains of the sanctuary of Ammon. 4. El Dakkel, or the Western Oasis, lies about 78 m. s.w. of Siout. The principal ruin at Dar-el-Hadjar consists of a small temple, dedicated to Khnumis by the Roman emperors Nero and Titus. At Ain Amoor, between this oasis and the Oasis Magna, is a temple built under the Roman empire.—Herodotus, iii. 26; Strabo, ii. p. 130, xvii. pp. 790, 791, 813; Ptolemy, iv. 5, 37; Minutoli, *Reise zum Tempel des Jupiter Ammon* (Berlin, 1824); Hoskins, *Visit to the Great Oasis* (8vo. Lond. 1837); Champollion, *L'Egypte*, p. 282.

***OAT,** or **OATS,** *Avēna*, a genus of grasses, containing many species, among which are some valuable for the grain which they produce, and some useful for hay. The Linnæan genus *avena*, less natural than most of the Linnæan genera, has been much broken up. The genus, as now restricted, has the spikelets in loose panicles, the glumes as long as the florets, and containing two or more florets; the paleæ firm, and almost cartilaginous, the outer palea of each floret, or of one or more of the florets, bearing on the back a knee-jointed awn, which is twisted at the base. The awn, however, tends to disappear, and often wholly disappears in cultivation. Those species which are cultivated as corn-plants have comparatively large spikelets and seeds, the spikelets—at least after flowering—pendulous. The native country of the cultivated oats is unknown, although most probably it is central Asia. There is no reference, however, to the oat in the Old Testament; and although it was known to the Greeks, who called it *bromos*, and to the Romans, it is probable that they derived their knowledge of it from the Celts, Germans, and other northern nations. It is a grain better suited to moist than to dry, and to cold than to warm climates, although it does not extend so far north as the coarse kinds of barley. The grain is either used in the form of groats (q.v.) or made into meal. Oat-meal cakes and porridge form great part of the food of the peasantry of Scotland and of some other countries. No grain is so much esteemed for feeding horses. Besides a large quantity of starch—about 65 per cent.—and some sugar, gum, and oil, the grain of oats contains almost 20 per cent of nitrogenous principles, or proteïne (q.v.) compounds, of which about 16 or 17 parts are *avenine*, a substance very similar to *caseïne* (q.v.), and two or three parts gluten, the remainder albumen. The husk of oats is also nutritious, and is mixed with other food for horses, oxen, and sheep. From the starchy particles adhering to the husk or *seeds* after the separation of the grain, a light dish, called *sowans* is made in Scotland by means of boiling water, was once very popular, and is very suitable for weak stomachs. The grain is sometimes mixed with barley for distillation. The Russian beverage called *quass* is made from oats. The straw of oats is very useful as fodder, bringing a higher price than any other kind of straw.—The varieties of oats in cultivation are very numerous, and some highly esteemed varieties are of recent and well-known origin. It is doubtful if they really belong to more than one species; but the following are very generally distinguished as species: 1. Common Oat (*A. sativa*), having a very loose panicle, which spreads on all sides, and two or three fertile florets in each spikelet, the paleæ quite smooth, not more than one floret awned; 2. Tartarian Oat (*A. orientalis*), also called Hungarian Oat and Siberian Oat, distinguished chiefly by having the panicle much more contracted, and all turned to one side; 3. Naked Oat (*A. nuda*), differing from the Tartarian oat chiefly in having the paleæ very slightly adherent to the seeds, which, therefore, fall readily out of them, whilst in the other kinds they adhere closely; 4. Chinese Oat (*A. chinensis*), which agrees with the last in the characters of the paleæ and seeds, but is more like the common oat in its panicle, and has more numerous florets, 4–8, in the spikelet; 5. Short Oat (*A. brevis*), which has a close panicle turned to one side, the spikelets containing only one or two florets, each floret awned, the grains short. Almost all the varieties of oat in cultivation belong to the first and second of these species. The naked oat is cultivated in Austria, but is not much esteemed. The Chinese oat, said to have been brought by the Russians from the north of China, is prolific, but the grain is easily shaken out by winds. The short oat is cultivated as a grain-crop on poor soils at high elevations in the mountainous parts of France and Spain, ripening where other kinds do not; it is also cultivated in some parts of Europe as a forage plant. Besides these, there is another kind of oat, the Bristle-pointed Oat (*A. strigosa*), regarded by some botanists as belonging even to a distinct genus, *danthonia*, because the lower palea is much prolonged, and instead of merely being bifid at the point, as in the other oats, is divided into two long teeth, extending into bristles. The panicle is inclined to one side, very little branched; the florets, 2 or 3 in a spikelet, all awned, the grain rather small. This plant is common in corn-fields, is cultivated in many countries, but chiefly on poor soils, and was at one time much cultivated in Scotland, but is now scarcely to be seen as a crop. Not unlike this, but with the panicle spreading equally on all sides, the outer palea merely bifid, and long hairs at the base of the glumes, is the Wild Oat (*A. fatua*), also frequent in corn-fields, and a variety of which is cultivated in some northern countries for meal, but which is more generally regarded by farmers as a weed to be extirpated, springing up so abundantly in some districts as to choke crops of better grain. Its awns have much of the hygrometrical property which gains for *A. sterilis*, a species found in the south of Europe, the name of the Animal Oat, because the seeds

when ripe and fallen on the ground resemble insects, and move about in an extraordinary manner through the twisting and untwisting of the awns. The seed of the WILD OAT has been sometimes used instead of an artificial fly for catching trout. Amongst the species of oat useful not for their grain but for fodder are the DOWNY OAT-GRASS (*A. pubescens*) and YELLOW OAT-GRASS (*A. flavescens*), both referred by some botanists to the genus *trisetum*—the short awn being like a middle tooth in the bifid palea—and both natives of Britain, the former growing on light ground and dry hills, especially where the soil is calcareous, the latter on light meadow lands. Other species are found in Britain, continental Europe, North America, Australia, etc. In some parts of the Sahara are bottoms of ravines richly productive of a species of oat-grass (*A. Forskalii*) much relished by camels.

Far more ground is occupied with oats in Scotland than with any other grain. In all the higher districts, it is almost the only kind of grain which is cultivated. Throughout Scotland it is the crop that is chiefly sown after land has been in pasture for one or more years. The seed is generally sown broadcast over the plowed land, which is afterwards well harrowed and pulverized. It is of the utmost importance to have the latter operations well done, as it prevents the attacks of insect larvæ. On soils that are infested with annual weeds, such as charlock, it is common to drill the seed, which permits the land to be hand-hoed and thoroughly cleaned. Oats thrive best upon deep and rich soils, and yield but poorly on thin sandy soils, where they suffer sooner from drought than barley, rye, or wheat. On good soils, it is common to dress oats with 2 to 3 cwts. of guano to the acre. The plant is not easily injured by large applications of heterogeneous manures. The potato oat is a variety generally cultivated in the best soils and climates. It is an early and productive variety. The Hopetoun oat is also much sown in the earliest districts. The sandy oat is still more largely sown, more particularly when the climate is inferior and wet. It is not liable to be lodged with rains, and the straw is of fine quality for fodder. All these are varieties of the common oat. The white and black Tartarian are much cultivated in some districts. They are very productive. On the continent of Europe this grain is seldom seen of quality equal to what is produced in Scotland; and even in most parts of England the climate is less suitable to it, and it is less plump and rich. See *Supp.*, page 892.

OATES, (*alias* AMBROSE,) TITUS, was the son of a ribbon weaver, who, having first become an Anabaptist minister under Cromwell, took orders and a benefice in the English church after the restoration. Titus appears to have been born about 1620 in London. He was a pupil of Merchant Taylor's school, whence he passed to Trinity college, Cambridge, took orders, and received a small living from the duke of Norfolk. This position, however, he forfeited, in consequence of a malicious prosecution, in which he narrowly escaped conviction for perjury; and having been afterwards appointed to the chaplaincy of one of the king's ships, he was expelled form it on a charge still more disgraceful. In this extremity he conformed to the Roman Catholic church, and was admitted as a scholar of the Jesuits' college at Valladolid; but was expelled for misconduct after a trial of a few months. He was again received by the Jesuits, on his earnest protestations of repentance, at St. Omer, where he was no less unsuccessful, and was finally dismissed by them in the early part of 1678. He now, as a mere vagabond adventurer, set himself to live by his wits, in the evil exercise of which he devised, about this time, the atrocious scheme with which his name is identified in history. Just then great excitement and alarm pervaded the Protestant party in England. It was well known that Charles was at heart a Roman Catholic; and his brother, the duke of York, afterwards James II., was an active and avowed zealot on the same side. The growing confidence of the Roman Catholics was unconcealed; and with or without instant reason, the cry so often since heard arose, and was everywhere re-echoed that the "Protestant religion was in danger." In this fevered state of general feeling, Oates saw his opportunity, and dexterously and boldly availed himself of it. He communicated to the authorities the details of a pretended plot, the figment of his own brain, the main elements of which were a rising of the Catholic party, a general massacre of Protestants, the burning of the city of London, the assassination of the king, and the invasion of Ireland by a French army. In certain of its items the fiction was devised with considerable ingenuity to catch the proper belief. By the strangest coincidence, moreover, there just then occurred in aid of it a series of events which seemed conclusively to attest its genuineness. A correspondence, the object of which was the propagation of the Roman Catholic religion, came to light between the secretary of the duke of York and Pere La Chaise, the confessor and confidant of Louis XIV. Danby, the prime minister, it also appeared, had been busy with intrigues in the same quarter. Finally, Godfrey, the zealous magistrate through whom publicity was first given to "the plot," was found mysteriously murdered. After this, could reasonable doubt exist? Was not the English St. Bartholomew already begun. All London went wild with fear and rage; and it seemed at one time likely that a massacre of Roman Catholics would be substituted for the dreaded extermination of the Protestants. The parliament, which might have done something to allay the excitement, was itself swept headlong away by it. The king alone, whose life was threatened, but who, dissolute and indolent as he was, wanted neither courage nor shrewdness, much to his honor, scornfully insisted that the plot was merely

some insane delusion, and tried, so far as he could, to control the excesses which followed. Too probably his interference was of the characteristically easy, *insouciant* kind; in any case, it did not avail. The story of Oates was universally believed and he became the popular hero of the day. A pension of £900 a year was granted him; a suite of apartments in the palace at Whitehall was set apart as sacred to his use; and wherever he went, the Protestant public wildly cheered him as their savior. With the aid of a set of suborned ruffians, only one degree less foul than himself, convictions of his victims were readily obtained, judges and juries vying with each other in their unquestioning reception in evidence of the grossest and most manifest perjuries; and many innocent Roman Catholic gentlemen died the death of traitors at the block. Over the space of two years, the base success of Oates was signalized by a series of judicial murders. Naturally, however, as reason resumed its sway, doubts began to be felt; and on the execution of a venerable and respected nobleman, viscount Stafford, with a strong shock of pity and remorse, public suspicion awoke, and a violent reaction set in. It was only, however, on the accession of James II., in 1685, that retribution overtook the malefactor. Active steps against him were then taken. He was tried before the court of king's bench, convicted of perjury, and sentenced to be pilloried, whipped at the cart's tail, and afterwards imprisoned for life. We might wonder a little at the leniency of the sentence, were it not thus to be explained: it was intended that the severity of the first two items of punishment should render the last one superfluous, and that the wretch should die under the lash of the executioner. But the hide of Oates was beyond calculation tough; and horribly lacerated, yet living, his carcass was conveyed to the prison, from which it was meant never more to issue. Very strangely, however, the next turn of the political wheel brought back the monster to the light of day and to prosperity. When the revolution of 1688 placed William on the throne, the Protestant influence triumphed once more. In the outburst of enthusiasm which ensued, what more natural than that Oates should be glorified as a Protestant martyr? Parliament solemnly declared his trial an illegal one; he was pardoned, and obtained his liberty; and in order to his perfect enjoyment of it, a pension of £300 a year was granted him. He was, however, no more heard of; he passed his 17 remaining years in obscurity, and died in in 1705 at the good old age of 86.

OATH (Ang.-Sax. *ath*, Ger. *eid*), in the religious use of the word, may be defined an expressed or implied calling upon the Almighty to witness the truth of an asseveration, or the good faith of a promise; with which is ordinarily conjoined an imprecation of his vengeance, or a renunciation of his favor, in case the asseveration should be false, or the promise should be broken. This practice has prevailed, in some form or other, in almost all the religions of the ancient, as well as of the modern world. It supposes, however, a belief of the existence of a provident Supreme Being, in order to its moral efficacy as a safeguard of truth. Among the Jews, we find instances in Gen. xiv. 22, xxi. 24, xlvii. 31, l. 5, confirmed even by the example of God himself, Numb. xiv. 28, Jer. xliv. 26, Isa. lxii. 8. It was strictly forbidden to the Jews to swear by false gods (Amos viii. 14, Jer. xii. 16). The form of oath was probably variable, either a direct adjuration as "The Lord liveth," or an imprecation, "The Lord do so to me;" but in all cases, the strongest denunciations are held out against the false swearer (Exod. xx. 7, Lev. xix. 12). Oaths were employed, both judicially and extrajudicially, by the ancient Egyptians, Assyrians, Medes, and Persians, as well as by the Greeks, and also by the Romans. The forms were very various—one of the most solemn consisting in the act of placing the hand on the altar of the deity who was invoked as witness. In the judicial proceedings of both the last-named nations, oaths were employed, but not universally; and in examples of their extrajudicial use, the literatures of both abound. In the Christian dispensation, the solemnity of an oath is enhanced by the elevated idea of the sanctity and perfection of the deity.

The lawfulness and fitness of the practice, under circumstances of due solemnity, are commonly recognized by Christians. Some communions, of which the most remarkable are the Moravians and the Society of Friends, applying literally the words of Christ (Matt. v. 34), regard all oaths as unlawful. But other communions generally restrict this prohibition to ordinary and private discourse, and find in Rom. i. 9, 2 Cor. xi. 21, Gal. i. 20, Phil. i. 8, and 1 Thess. ii. 5, full warrant for the lawfulness of oaths in judicial and other solemn use. From some passages of the fathers, it might seem that they shared the difficulties of the Quakers and Moravians on the subject of the lawfulness of swearing; but these fathers for the most part referred to the oaths required of Christians by the pagans, which generally involved a recognition of particular pagan divinities; and they condemned these pagan oaths, rather as involving or even directly containing a profession of the popular paganism than as unlawful in themselves. The Christians of the later ages may perhaps be said to have multiplied in an opposite degree the occasions of oaths; especially of what were called "purgatorial" oaths, in which a party charged with a crime justified himself by swearing his innocence. These oaths were commonly accompanied by some imprecatory form or ceremonial, and were often expected to be followed by immediate manifestations of the divine vengeance upon the perjurer. The common instrument of attestation on oath was the Bible or some portion of it; but oaths were sometimes sworn on the relics of saints, or other sacred objects; sometimes simply

by raising the hand to heaven, or by laying it upon the breast or the head. In canonical processes, the oath was often administered to the party kneeling. The forms varied very much; the most general being that which the English oath still retains (*Sic me Deus adjuvet*). Divines commonly require, in order to the lawfulness of an oath, three conditions (founded upon Jer. iv. 2), viz., *truth*, *justice*, and *judgment*—that is to say (1), that the asseveration, if the oath be assertive, shall be *true*, and that the promise, if the oath be promissory, shall be made and shall be kept *in good faith;* (2), that the thing promised shall be objectively lawful and good; (3), that the oath shall not be sworn without due discretion and deliberation, and without satisfactory reasons founded on necessity, or at least on grave and manifest utility.

The Mohammedans do not employ oaths in their judicial proceedings; but they regard deliberate perjury, even when extrajudicially committed, as sinful, and deserving of God's vengeance. For this, however, they require that the oath should be an express adjuration of God himself by some one of his well-known holy names; that the jurant should be of full age and intelligence; and that the oath should be sworn deliberately, and with the intention of swearing.

***OATH,** in point of law, is that kind of solemn declaration which is necessary as a condition to the filling of some office more or less public, or of giving evidence in a court of justice. Nearly all the great public offices of the state in this country can only be filled by persons who are willing to take an oath before acting in such office. The most important office of all—that of king or queen of Great Britain—requires a coronation oath (q.v.). Members of parliament also require to take the oath of fidelity and true allegiance, and promising to maintain the succession, in a full house, before taking their places (29 and 30 Vict. c. 19). Quakers and others may make an affirmation to the same effect. In 1868 and 1871 great changes were made as to oaths. The oath of allegiance and the official oath must now be taken by the great officers of state, such as the first lord of the treasury, chancellor of the exchequer, lord chancellor, secretaries of state, etc., in England. In Scotland the same are taken by the lord keeper of the great seal and privy seal, lord clerk register, lord advocate, and lord justice-clerk; so in Ireland by the lord lieutenant, lord chancellor, and two others. The oath of allegiance and the judicial oath are taken by the superior judges in each kingdom, justices of the peace, and Scotch sheriffs. No others, except under the clerical and parliamentary oaths acts, are to take the oaths of allegiance, supremacy, and abjuration, or any oath substituted for these. All others who used formerly to take oaths now make declarations of fidelity in their office, and in some cases also one of secrecy.

The most important oaths affecting the general public are those which are required to enforce the truth from witnesses in courts of justice. It may be stated that jurymen, where they are called upon to exercise their functions, are also required to take an oath. The oath is read to the juror thus—"You shall well and truly try the issue between the parties, and a true verdict give, according to the evidence, so help you God;" and the juror kisses the New Testament. Witnesses who are called to give evidence must all be first sworn in a similar manner, the words being, "The evidence you shall give shall be the truth, the whole truth, and nothing but the truth, so help you God." Hence the person who is a witness must have sufficient understanding to know the nature and obligations of an oath; and on this ground, young children are incompetent to be witnesses. Another condition or qualification required in the party who takes an oath as a witness is, that he has a competent sense of religion, in other words, he must not only have some religious knowledge, but some religious belief. He must, in substance, believe in the existence of a God, and in the moral government of the world; and though he cannot be questioned minutely as to his particular religious opinions, yet, if it appear that he does not believe in a God and future state, he will not be allowed to give his evidence, for it is assumed, that without the religious sanction, his testimony cannot be relied upon. So long, however, as a witness appears to possess competent religious belief, the mere form of the oath is not material. The usual practice in England and Ireland is, for the witness, after hearing the oath repeated by the officer of court, to kiss the four gospels by way of assent; and in Scotland, the witness repeats similar words after the judge, standing and holding up his right hand, "swearing by almighty God, as he shall answer to God at the great day of judgment," but without kissing any book. Jews are sworn on the Pentateuch, keeping on their hats, and their oath ends with the words, "so help you Jehovah." A Mohammedan is sworn on the Koran; a Chinese witness has been sworn by kneeling and breaking a china saucer against the witness-box. Thus the mere form of taking the oath is immaterial; the witness is allowed to take the oath in whatever form he considers most binding upon his own conscience—the essential thing being, however, that the witness acknowledge some binding effect derived from his belief in a God or a future state.

The policy of insisting upon the religious formalities attending the taking of an oath, has been much discussed of late years, and it has been disputed whether atheists, who avow an entire absence of all religious belief, should be entirely rejected as witnesses (as is sometimes the case), and justice be thereby frustrated. The objections of Quakers, Moravians, and Separatists to taking an oath have long been respected as not being fundamentally at variance with a due sense of religious feeling, and hence they have by

statute been allowed to make an affirmation instead of taking the oath. In 1854 another concession was made to those who, not being Quakers, yet refuse to take the oath from sincere conscientious motives, and these are now also allowed to affirm instead of swear. But the law remains as before, that atheists and persons who admit that they have no religious belief, cannot give evidence in courts. See BRADLAUGH, CHARLES.

When a witness, after being duly sworn, gives false evidence in a court of justice or in a judicial proceeding, and his evidence so falsely given is material, he commits the offense of *perjury;* but it is necessary, in England, not only that two witnesses shall be able to prove the falsity of such evidence, but also that the party should be proceeded against, in the first instance, before a justice of the peace, or by order of a judge, or the attorney-general, it being found that frivolous and unfounded indictments were often preferred against witnesses by disappointed or hostile parties. As a general rule, perjury cannot be committed except in some judicial proceeding, or rather the giving of false evidence cannot be punished except it has been given in some judicial proceeding. The practice formerly existed of persons voluntarily taking oaths in various matters not connected with any judicial proceeding; and creditors often in this manner sought to add to other securities by insisting on a formal oath before a justice of the peace, in some isolated matter of fact. This practice was put an end to by the statute 5 and 6 Will. IV. c. 62, by which justices of the peace were prohibited from administering or receiving such oaths touching any matter or thing whereof such justice has not jurisdiction or cognizance by some statute. It is left to some extent to the discretion of the justice whether the particular matter is one as to which it is proper to administer an oath; but when it is considered proper, the declaration may be made in the form given by that statute; and if the party make a false declaration, he commits a misdemeanor. Unlawful oaths generally mean oaths taken by members of secret and illegal societies of a treasonable description; and statutes long ago passed to inflict penalties on all who took or adminstered such oaths. See *Supp.*, page 893.

OATH OF CALUMNY, in Scotch law, means an oath taken by a party at the instance of his opponent, that the allegations were well founded. Oaths of verity and credulity are oaths that a debt or claim is well founded.

OATHS, MILITARY. The taking of the oath of fidelity to government and obedience to superior officers, was, among ancient armies a very solemn affair. A whole corps took the oath together, sometimes an entire army. In modern times, when so many other checks are used for maintaining discipline, the oath has become little more than a form. In the United Kingdom a recruit enlisting into the army or militia, or a volunteer enrolling himself, swears to be faithful to the sovereign, and obedient to all or any of his superior officers; also to divulge any facts coming to his knowledge which might affect the safety of his sovereign, or the stability of that sovereign's government. The members of a court-martial take an oath to try the cases brought before them justly, according to the evidence, to keep secret the finding until confirmed by the crown, and to keep secret always the opinions given by the members individually. The only other military oath is the common oath of a witness before a court-martial to tell the truth, the whole truth, and nothing but the truth.

OAXA'CA. See OAJACO.

OB, or OBI, the great river of western Siberia, rises in two branches, the Bia and the Katune or Katunga, both of which have their origin in the Altai mountains, within the frontier of the Chinese dominions, about lat. 49° n., and long. 90° east. These branches flowing in a n.w. direction, unite to form the Ob at the town of Biisk in lat. 52° 30′ n., long. 85° east. Pursuing a winding course, with a general n.w. direction, the Ob reaches the meridian of 75° e., when it turns w., and maintains that direction to its confluence with the Irtish, the greatest of its tributaries. It then flows n.w., n., and n.e. to its mouth in the gulf of Ob, which it reaches after a course of 2,000 miles. Its chief affluents on the right are the Tom—a swifter stream than the Ob, 400 m. in length, and navigable for the last 280 m. from the beginning of May till July—the Tchulim, and the Ket. The principal affluent on the left is the Irtish, which, rising within the frontier of the Chinese territories, traverses the Altai mountains, and after a course longer than that of the Ob itself, joins that river 250 m. below Tobolsk. The trade of the Irtish, of which the center is Tobolsk, is important. The principal towns on the banks of the Ob are Narim, Sargut, Berezow, and Obdorsk.—The gulf of Ob is a long inlet of the Arctic ocean, 450 m. in length by about 100 m. in breadth. At present only a few steamers ply on the great water-system of the Ob; but that system, communicating as it does between Siberia, the Chinese territories, and European Russia, is, without doubt, destined to become a great commercial thoroughfare. The explorations of prof. Nordenskjöld, but more especially the tentative voyages of capt. Wiggins in 1874 and 1876, from Dundee through the Kara sea to the gulf of Ob, have amply proved the feasibility of this direct route. This river is very rich in fish. Below its junction with the Irtish it divides itself into several parallel streams; and in the flood season it inundates great tracts of country, and presents the appearance of a waste of waters, its desolate uniformity broken only by the occasional tree-tops that rise above the surface. At Obdorsk, about 20 m. s. of the southern border of the gulf of Ob, the river freezes in the middle of October, and breaks up about the middle of May.

OBADI'AH, one of the "minor prophets" of the Old Testament, regarding whom absolutely nothing is known. His book or "vision"—the shortest of the Jewish Scriptures—appears, from internal evidence, to have been composed after the destruction of Jerusalem by the Chaldæans, 588 B.C., and consists of two parts. The first is a prophecy of the downfall of Edom. The second foretells the future redemption and glory of the house of Jacob, in which Edom—for his unbrotherly conduct—shall not share, but, on the contrary, be burned up as "stubble."

OBADIAH (*ante*), the fourth of the minor prophets, according to the Hebrew and English arrangement, and the shortest book in the Old Testament. Some have conjectured that the author of it was the steward of Ahab's household; but this opinion has nothing to support it except the identity of name. There are several striking resemblances between Obadiah and Jeremiah, Joel and others of the minor prophets; but critics have not succeeded in determining to whom priority of date is to be assigned. The better opinion, however, seems to be that Obadiah preceded Jeremiah, or was contemporary with him. His prophecy is a denunciation of Edom, the inhabitants of which are addressed as deceived by their pride and fancied security, from which they would be utterly cast down; and as denounced for their violence against Israel, their refusal to help him, their joy over his calamities, and their profit from his fall. Their doom is to be in the line of their sin; as they had done to others so it should be done to them. In contrast with their sin and destruction, the deliverance and holiness of Zion would be conspicuous; Jacob and Joseph would be as a fiery flame, and Esau would be consumed as stubble. The inhabitants of the south would possess Idumea, and those of the plain, Philistia; Judah would extend to Samaria, Benjamin to Gilead, and the captives of the ten tribes, to the borders of Sidon; saviors would dwell in Zion, and the kingdom would be the Lord's.

O'BAN, a parliamentary burgh and sea-port, Argyleshire, Scotland, on a bay of the same name, 20 m. (in direct line) n.w. of Inveraray. The bay is protected from every wind by the island of Kerrera on the w., and by the high shores of the main-land, and is overlooked on the n. by the picturesque ruins of Dunolly castle. It is from 12 to 24 fathoms deep, and although the girdle of hills that seems to surround it gives it the appearance of a lake, it is easily accessible, and could afford anchorage to 300 sail. Oban is the great rendezvous for tourists in the west Highlands. Its importance dates chiefly from the beginning of the present century. The burgh now contains a number of churches, several hotels and inns, schools, banks, etc. Within 3 m. of Oban is Dunstaffnage castle, which is said to have been the seat of the Scottish monarchy previously to its transference to Scone. The stone of destiny, which now supports the coronation chair in Westminster abbey, and was carried thither from Scone by Edward I., was obtained, in the first instance, according to tradition, from Dunstaffnage castle. Pop. of parliamentary burgh—which is one of the Ayr (q.v.) group—was 1,940 in '61 ; in '81, 4,046. A r. r. from Calander to O. connects it with Glasgow and Edinburgh.

OBE, or OBI (etymology unknown), the name given to the magical arts or witchcraft practiced by a class of persons among the negroes of the West Indies. The practicer is called an *obeah-man* or *obeah-woman*. It differs in no essential respect from the corresponding superstitions all the world over. See MAGIC, WITCHCRAFT.

OBEDIENCE, in canon law means the duty by which the various gradations in ecclesiastical organization are held subject, in all things consistent with the law of God or of the church, to the several superiors placed immediately above each, respectively, in the hierarchical scale. Thus priests and inferior clergy owe canonical obedience to the bishop, and priests are bound thereto by a solemn promise administered at ordination. The bishop primitively took a similar oath to the metropolitan; but by the modern law, the jurisdiction of the metropolitan is confined to the occasions of his holding a visitation, or presiding in the provincial synod. Bishops, by the present law of the Roman Catholic church, take an oath of obedience to the pope. This obedience, however, is strictly limited by the canons, and is only held to bind in things consistent with the divine and natural law. In ecclesiastical history the word obedience has a special signification, and is applied to the several parties in the church, which, during the great western schism (q.v.), adhered to the rival popes. Thus we read of the "Roman obedience," which included all who recognized the pope chosen at Rome, and the "Avignon obedience," which meant the supporters of the Avignon pope. So, again, historians speak of "the obedience of Gregory XII.," and "the obedience of Benedict XIII.," etc. Applied to the monastic institute, obedience means the voluntary submission which all members of religious orders vow, at the religious profession, to their immediate superiors, of whatever grade in the order, as well as to the superior general, and still more to the rules and constitutions of the order. This forms, in all orders, one of the essential vows. It is, however, expressly confined to lawful things; and although it is held that a superior can command certain things under pain of sin, yet Roman Catholics repudiate the notion that the command of a superior can render lawful, much less good, a thing which is of its own nature, or by the law of God, sinful or bad. The name obedience is sometimes given to the written precept or other formal instrument by which a superior in a religious order communicates to one of his subjects any special precept or instruction—as, for example, to undertake a certain office, to proceed upon a particular mission,

to relinquish a certain appointment, etc. The instruction, or the instrument containing it, is called an obedience, because it is held to bind in virtue of religious obedience.

OBEID′, EL, a t. in s. Kordofan, e. central Africa, capital of the province; 250 m. s.w. of Sennaar and about 120 m. w. of the Nile, which forms the e. boundary of the state; pop. about 30,000. The town consist mainly of straw or reed huts, but there are 5 mosques, a market-place, and a hospital. The place is in the midst of a wild plain, and a strong thorn hedge is necessary to keep off the wild beasts at night. The exports are ivory, gold, silver, hides, ostrich feathers, and gums.

OBEIDULLAH, Sheikh. See page 893.

O'BEIRNE, Thomas Lewis, d.d., 1748–1823; b. Ireland; was educated at St. Omer's, a Roman Catholic college in France; became Protestant, and took orders in the Episcopal church; was chaplain of lord Howe's fleet at the beginning of the American war for independence; in 1776 he preached in St. Paul's, the only Episcopal church in New York city not destroyed by the great fire of that year; in 1782 acted as private secretary to the lord lieut. of Ireland, and received from him in 1783 two valuable livings, in Northumberland and Cumberland; in 1796 he was made bishop of Ossory, and in 1798 was translated to the see of Meath, where he died. He was the author of a *Vindication* of the conduct of admiral and of gen. Howe, some political tracts, and a poem, *The Crucifixion.*

OB′ELISK, a word derived from the Greek *obelos* and *obeliskos*, signifying a spit, applied to prismatic monuments of stone and other materials, terminating with a pyramidal or pointed top. These monuments, called *tekhen*, were placed upon bases before gateways of the principal temples in Egypt, one on each side of the door. They served in Egyptian art for the same purposes as the stelæ of the Greeks and columns of the Romans, and appear to have been erected to record the honors or triumphs of the monarch. They have four faces, are cut out of one piece, and are broader at the base than at the top, at a short distance from which the sides form the base of a pyramidion in which the obelisk terminates. They were placed upon a cubical base of the same material, which slightly surpassed the breadth of their base. Each side of the obelisk at the base measures $\frac{1}{10}$th of the height of the shaft, from the base line to that where the cap, or pyramidion commences. The cap is also $\frac{1}{10}$ of the same height. Their sides are slightly concave, to increase their apparent height. Their height varies from upwards of 100 ft. to a few inches, the tallest known being that of Karnak, which rises to 105 ft. 7 inches. The sides are generally sculptured with hierogylphs and representations, recording the names and titles of kings, generally in one line of deeply-cut hieroglyphs down each side. The pyramid of obelisks was sometimes decorated with subjects. The mode by which they were made appears to have been to hew them first in the rough out of a solid piece in the quarries, and one unfinished specimen thus prepared still remains in the quarries of Syene. They were transported down the Nile during the inundation, on rafts to the spot where they were intended to be placed, and raised from their horizontal position by inclined planes, aided by machinery. Some obelisks, before their erection, had their pyramid capped with bronze gilded, or gold, the marks of such covering still being evident on their surfaces. Under the Roman empire, they were raised by pulleys and heavy tackle. The difficulty of erecting the fallen ones in the ages of renaissance, as also the mechanical appliances for the lowering from its original site the obelisk of Luxor in 1831, and erecting it in the Place de la Concorde in 1833 by Le Bas, show the difficulties experienced by the ancients. The use of obelisks is as old as the appearance of art itself in Egypt; these grand, simple, and geometric forms being used in the 4th dynasty, and continued till the time of the Romans. Their object is enveloped in great obscurity. At the time of the 18th dynasty, it appears that religious ceremonies and oblations were offered to the obelisks, which were treated as divinities. Their sepulchral use is evinced by their discovery in the tombs of the 4th dynasty, and the vignettes of early papyri. No large obelisk is older than that of Matarieh or Heliopolis, erected by Osortesen I. about 1900 b.c.; and that of Beggig or Crocodilopolis is, in reality, only a stele. Thothmes I. placed two of large size before the granite sanctuary of Karnak, and his daughter Hatasu, two others of above 90 ft. high before the second propylæon. Additional sculptures were made on these obelisks by Sethos I., who restored them. Thothmes III. appears to have erected many obelisks. The oldest is that of the Atmeilan or Hippodrome of Constantinople, erected to record his conquests of Naharania or Mesopotamia. Two others, which formerly stood at Heliopolis, were subsequently re-erected by Rameses II. at Alexandria, and have been popularly known as Cleopatra's Needles. One still stands there erect; the other, which long lay prostrate, was after an adventurous voyage brought to London in 1878, and erected on the Thames embankment. The highest of all obelisks, that of St. John of the Lateran, appears to have been removed from Thebes, and set up by Thothmes IV. A small obelisk of Amenophis II., said to have been found in the Thebaid, apparently from Elephantine, is in the collection of the duke of Northumberland at Sion. Sethos I. commenced the Flaminian obelisk, subsequently completed by Rameses II., and placed at the temple of Heliopolis. It was removed to Rome by Constantius, and found 16 ft. under the surface in the pontificate of Gregory XIII., and erected in that of Sextus V. by the architect Fontana. The other obelisks of Rameses II. are, the one at the Luxor quarter of Thebes, the companion of which was removed to the Place de la Concorde at Paris in 1833; the two obelisks of

San or Tanis; that of the Boboli gardens of Florence, transported from the circus of Flora at Rome; the obelisk of the Rotonda at Rome, erected by Clement XII., 1711 A.D.; and that of the Villa Mattei, which decorated the Ara Cæli of the capitol. A fragment of another obelisk was in the Collegio Romano. No obelisks are known of other monarchs till the 26th dynasty. That of the Monte Citorio at Rome, erected by Psammetichus II. at Heliopolis, was transported by Augustus to the Campus Martius, having been exhumed 1748 A.D., and erected by the architect Antinori in that of Pius VI. Two other obelisks of small size, made of black basalt, dedicated by Nekhtherhebi or Nectanebes II, at Hermopolis, commonly known as the obelisks of Cairo, are in the British museum. Ptolemy Philadelphus is said to have erected in the Arsinoeum at Alexandria a plain obelisk of 80 cubics, cut in the quarries by Nectabis. It was set up by the architect Satyrus. Two obelisks, erected by Ptolemy Euergetes II. and his wife Cleopatra, stood before the temple of Philae, one of which was removed to Corfe castle by Mr. Bankes. The so-called Pamphiliano obelisk at Rome, erected by E. Bernin in 1651, in the Piazza Navona, under the pontificate of Innocent X., was removed from the Circus of Maxentius, having, as their hieroglyphical legends testify, been originally erected by Domitian before the Serapeum at Rome. The last of the Roman obelisks was the Barberini, which was found in 1633 on the site of the Circus of Aurelian, and finally erected in 1822 on the Monte Pincio. It was placed by the emperor Hadrian before the mausoleum or cenotaph either of himself or Antinous, between 132–8 A.D. Barbarous hieroglyphs, found on the Sallustian obelisk, are copied from the Flaminian obelisk. It is supposed to have been transported to Rome, unadorned with hieroglyphs, by Sallustius Crispus, prefect of Numidia, and to have been set up in the gardens of Sallust, in the reign of Vespasian. It was erected by Antinori, 1789, before the Church of Trinita del Monte. It has been seen how, on the renaissance of the arts, the obelisks were restored and applied to the embellishments of modern Rome, either as columns in the centers of piazzas or squares, or else as the ornaments of fountains; one obelisk being set up alone in the center of the piazzas and places of Italy and France, while in antiquity they always stood in pairs before the Pylons.

Two small obelisks, and the apex of a third, have been found in Assyria, in shape of truncated prisms, the apices step-shaped. The most interesting is that of the n.w palace of Nimrud, of black marble, is 5 ft. 9 in. high. Each side has five compartments of bas-reliefs, representing the tribute and offerings made to the Shalmanaser. It is covered with a cuneiform inscription, recording the annals of the king's reign, from his first to his 31st year. On it is represented the tribute of Jehu, king of Israel. A second obelisk, of white marble, measures 8 ft. 2 in. high, is covered with bas-reliefs, representing scenes of war and tributes, winding round it like those of a Roman triumphal column. On it is an inscription of Shamas-Pul. The broken apex of a third has a dedication from Ashur-izir-'pul II. An obelisk of Semiramis at Babylon is mentioned by Diodorus, and another of Aricarus was interpreted by Democritus. Under the Roman empire. obelisks were used as gnomons, placed in the public spaces, or erected in the *spina* of the *circi*. The first removal of obelisks to Rome took place in the reign of Augustus, who placed one in the circus, said to been originally erected in the reign of Semenpsertus, 85¼ ft. high; and another of 9 ft. less, in the Campus Martius, and had it adjusted as a gnomon by the mathematician Facundus Novus; a third obelisk was erected in the Circus of Caligula and Nero in the Vatican, and originally dedicated to the sun by Nuncoreus, the son of Sesosis, on the recovery of his sight. Two other small obelisks, which decorated the mausoleum of Augustus, and were erected by Claudius or Vespasian and his sons, have been found. Other obelisks are known to have been removed by Constantius, 354 A.D. P. Victor, in his description of the quarters of ancient Rome, reckons 6 of the largest size and 42 others. The Romans added to them brazen spheres and other decorations. Some were removed to Constantinople by Theodosius the younger, and Valentinian, 390 A.D. The translation of the inscription of one of the Roman obelisks made by a Greek or Egyptian, named Hermapion, has been preserved by Ammianus Marcellinus.—Kircher, *Œdipus Ægyptiacus* (tom. iii. Rom. 1652–54); Zoega, *De Origine et Usu Obeliscorum* (fo. Rom. 1797); Cipriani, *Sui Dodici Obelisci di Roma* (fo. Rom. 1823); L'Hôte, *Notice Historique sur les Obélisques Egyptiens* (8vo, Paris, 1836); Birch, *Notes upon Obelisks in the Museum of Classical Antiquities* (8vo, Lond. 1853, pp. 203–39; Layard, *Nineveh and its Remains*, vol. i. p. 346; Sir H. Rawlinson, *A Commentary on the Cuneiform Inscriptions* (12mo, Lond. 1850).

OB'ELISK (*ante*). One of the obelisks of Rameses II. at Alexandria, was removed to London in 1879, and another was given by the khedive of Egypt and brought to this country by the *Dessoug*, commander H. H. Gorringe. It arrived in New York, July 21, 1880, and was set up in Central park, with appropriate ceremonies, and addresses by William M. Evarts and others, Feb. 22, 1881. The expense of removal and erection was defrayed by William H. Vanderbilt, of New York.

OBER-AMMERGAU. See MYSTERIES and MIRACLE PLAYS, *ante*.

OBERLIN, a village in Lorain co., Ohio, on the Lake Shore and Michigan Southern railroad, 34 m. s.w. of Cleveland; the seat of the well-known Oberlin college; pop. '80, exclusive of the students, 3,242. The village has 6 churches, a national bank, a union school-house, a conservatory of music, a hotel, and 2 newspaper offices. The First

Congregetional church is of brick, and will accommodate 3,000 people. The village has a machine shop, a car factory, planing, flour, and saw-mills. It has always been noted for its strictness of morals and its high religious tone.

OBERLIN, JOHANN FRIEDRICH, distinguished for his active benevolence and usefulness, was b. at Strasburg, Aug. 31, 1740; and in 1766 became Protestant pastor of Waldbach, in the Ban de la Roche or Steinthal, a wild mountainous district of Alsace. Here he spent the remainder of his life, combining an affectionate diligence in the ordinary duties of the pastorate, with wise and earnest endeavors to promote the education and general prosperity of the people. The district had suffered terribly in the thirty years' war, and the scanty population which remained was sunk in poverty and ignorance. Oberlin introduced better methods of cultivating the soil, and various branches of manufacture. The population, which was scarcely 500 when he entered on his labors, had increased to 5,000 at the close of the century. Yet, though animated in all his actions by the most pure and disinterested piety, it may be questioned if he did not carry his moral supervision too far when he kept a register of the moral character of his parishioners, and searched with the minuteness though not the motives of an inquisitor, into the most insignificant details of their private life. Oberlin was ably assisted in his reformatory labors by his pious housekeeper, Luise Schepler, who survived her master eleven years. He died June 1, 1826. Notwithstanding the humble sphere in which his days were spent, his fame as a philanthropist has extended over the world, and his example has stimulated and guided many. See *Brief Memorials of Oberlin*, by the rev. T. Sims, M.A. (Lond. 1830), the *Memoirs of Oberlin* (1852), the biography by Bodemann (1868), and that by Spach (Paris, 1866).

OBERLIN COLLEGE, at Oberlin, Lorain co., Ohio, was founded in 1834 as a Christian institution for the liberal education of both sexes under conditions favorable to persons of limited pecuniary resources. It admits students without distinction of sex or color. It has a preparatory department, embracing a classical school with a three years' course, and an English school. The department of philosophy and the arts embraces the classical and scientific or regular "college" course, and the literary course; the study of Greek and in part that of Latin and mathematics being omitted from the latter. The theological department is in close though not official relations with the Congregationalists. It has an endowment of $30,000. The college itself has a fund of $115,000, and scholarships are available to students at a low rate. The college buildings, though plain are spacious and convenient. There is also a conservatory of music. Number of instructors in 1885, 44; students, 1,314. President, James H. Fairchild, D.D.

OBERLIN THEOLOGY, designates the peculiar views generally supposed to have been taught at Oberlin college during the earlier years of its history, by its president the rev. Charles G. Finney and his colleagues. Many from without on the one hand looked at the institution through the mists of prejudice and misapprehension; and on the other hand the views actually held and taught within the college were probably improved by increased reflection and growth in the Christian life. 1. The general system of doctrine taught was of a modified Calvinistic type in which the leading thoughts seemed to be that responsibility pertains to the voluntary action of the will, and that every moral agent determines freely for himself, under the pressure of the motives around him, all that is blameworthy or commendable in his character and conduct; that sin is a voluntary failure in duty and holiness a voluntary performance of it; and that a voluntary total moral depravity exists among unregenerate men. The repentance which is a condition of salvation is a forsaking of sin, the obligation to forsake it resting on the sinner, and the power to forsake it being always within his reach. The power to commit sin implies the power to forsake it. The Holy Spirit's work in conversion is a moral work effected by the presentation of motives through the truth; and the consequent work of sanctification is of a similar kind. As God's sovereignty works in harmony with human freedom, one factor in a man's salvation is his own voluntary consent. As sin cannot be imputed where it is not committed, so righteousness cannot be where it is not possessed. Hence the atonement does not include the transfer of human guilt to Christ or of his righteousness to men; but rather so exhibits in the cross of Christ the faithfulness and love of God, in contrast with the sinfulness of man, as to render the forgiveness of the penitent sinner safe and right. 2. The views concerning the nature of virtue taught at Oberlin were at their basis those of president Edwards, making the well-being of the sentient universe the highest ultimate good; and consequently the voluntary regard for this good, which is called benevolence, the vital element in all virtue. 3. The Oberlin doctrine of sanctification is determined by the view taken of moral action as necessarily right or wrong; and therefore of moral character as being necessarily at any one instant, either perfectly holy or perfectly sinful. If this be so, conversion necessarily becomes entire consecration, and obedience and faith are essentially complete. The difficulty with the Christian is that he is weak, inexperienced, and liable to temptation. Sanctification therefore becomes a gradual attainment of experience and strength, through repeated enlightenments by the Holy Spirit, accompanied by patient continuance in well doing. And the baptism of the Holy Spirit is to be sought by prayer with faith in the promise of Christ. The Oberlin theology has of late years lost its distinctness, and has been merged in the general current of Christian doctrine.

O'BERON, the king of the elves or fairies, and the husband of Titania. The name is derived by a change of spelling from *Auberon*, more anciently *Alberon*, and that from the German *Alberich*, i.e., king of the Elves. Oberon is first mentioned as "Roi du royaume de la féerie" in the old French poem of *Huon de Bordeaux, pair de France*, which was afterwards made the basis of a popular prose romance. From the French, Oberon was borrowed by the English poets, Chaucer, Spenser, and others, but he is most familiarly known from his appearance in Shakespeare's *Midsummer Night's Dream*. From old French sources, also, Wieland derived part of the materials of his poem of *Oberon*.

OBE'SITY, or CORPULENCE, may be defined to be "an accumulation of fat under the integuments or in the abdomen, or in both situations, to such an amount as to embarrass the several voluntary functions." A certain degree of fatness is not only quite compatible with health, but, as has been shown in the article FATS, ANIMAL, the fatty tissue is of considerable use in the animal body, partly in consequence of its physical, and partly in consequence of its chemical properties; and it is only when the fatness begins to interfere with the discharge of any of the vital powers, that it can be regarded as a morbid condition. Obesity may occur at any period of life, but it is most commonly after the fortieth year that the tendency to an inordinate accumulation of fat begins to show itself. After that time, in the case of men, the pleasures of the table are usually more attractive than in earlier life, and much less muscular exercise is taken; while in women, the cessation of the power of child-bearing induces changes which tend remarkably to the deposition of fat. The extent to which fat may accumulate in the human body is enormous. Daniel Lambert, who died at the age of forty years, weighed 739 lbs.; his exact height is not recorded, but, according to the investigations of the late Dr. Hutchinson (the inventor of the spirometer), the normal weight of a man 6 ft. high should not exceed 178 lbs. Dr. Elliotson has recorded the case of a female child, a year old, who weighed 60 lbs.; and those who are interested in the subject will find a large collection of cases of obesity in Wadd's *Cursory Remarks on Corpulence*.

The predisposing causes of obesity are a peculiar habit of body, hereditarily transmitted; inactivity; sedentary occupations, etc.; while the more immediate or exciting causes are a rich diet, including fatty matters, and matters convertible in the body into fats, such as saccharine and starchy foods, and the partaking of such a diet to a greater extent than is necessary for balancing the daily waste of the tissues. "Fat meats, butter, oily vegetable substances, milk, saccharine and farinaceous substances are the most fattening articles of food; whilst malt liquors, particularly rich and sweet ale are, of all beverages, the most conducive in promoting obesity. The fattening effect of figs and grapes, and of the sugar-cane, upon the natives of the countries where these are abundant, is well known. In various countries in Africa and the east, where obesity is much admired in females, warm baths, indolence, and living upon saccharine farinaceous articles, upon dates, the nuts from which palm-oil is obtained, and upon various oily seeds, are the means usually employed to produce this effect."—Copland's *Dictionary of Medicine*, article "Obesity." The knowledge of the means of inducing obesity affords us the best clue to the rational treatment of this affection. It is a popular belief that the administration of acids—vinegar, for example, or one of the mineral acids—will check the deposition of fat; but if the desired effect is produced, it is only at the cost of serious injury to the digestive, and often to the urinary organs. The employment of soap and alkalies, as advocated a century ago by Dr. Flemyng (*A Discourse on the Nature, Causes, and Cure of Corpulency*, 1760), is less objectionable than that of acids, but the prolonged use even of these is usually prejudicial. The efficacy of one of our commonest sea-weeds, sea-wrack (*Fucus vesiculosus*), in this affection has also been strongly advocated. It is prescribed in the form of an extract, and its value is probably dependent on the iodine contained in it.

A very interesting *Letter on Corpulence*, published in 1863 by Mr. Banting, in which he records the effect of diet in his own case, after all medicinal treatment had failed, is well worthy of the attention of those who are suffering from the affection of which this article treats. The following are the leading points in his case. He was 66 years of age, about 5 ft. 5 in. stature (and therefore, according to Dr. Hutchinson's calculations, ought to have weighed about 142 lbs.), and in Aug., 1862, weighed 202 lbs. "Few men," he observes, "have led a more active life . . . . so that my corpulence and subsequent obesity were not through neglect of necessary bodily activity, nor from excessive eating, drinking, or self-indulgence of any kind, except that I partook of the simple aliments of bread, milk, butter, beer, sugar, and potatoes, more freely than my aged nature required . . . . I could not stoop to tie my shoe, nor attend to the little offices humanity requires without considerable pain and difficulty; I have been compelled to go down stairs slowly backwards, to save the jar of increased weight upon the ankle and knee joints, and been obliged to puff and blow with every slight exertion" (pp. 10 and 14).

By the advice of a medical friend, he adopted the following plan of diet: "For breakfast I take 4 or 5 ounces of beef, mutton, kidneys, broiled fish, bacon, or cold meat of any kind except pork; a large cup of tea (without milk or sugar), a little biscuit, or one ounce of dry toast. For dinner, 5 or 6 ounces of any fish except salmon, any meat except pork, any vegetable except potato, one ounce of dry toast, fruit out of a pudding,

any kind of poultry or game, and 2 or 3 glasses of good claret, sherry, or Madeira: champagne, port, and beer forbidden. For tea, 2 or 3 ounces of fruit, a rusk or two, and a cup of tea without milk or sugar. For supper, 3 or 4 ounces of meat or fish, similar to dinner, with a glass or two of claret (p. 18). I breakfast between 8 and 9 o'clock, dine between 1 and 2; take my slight tea meal between 5 and 6; and sup at 9" (p. 40). Under this treatment he lost in little more than a year (between Aug. 26, 1862, and Sept. 12, 1863) 46 lbs. of his bodily weight, while his girth round the waist was reduced 12¼ inches. He reported himself as restored to health, as able to walk up and down stairs like other men; to stoop with ease and freedom; and safely to leave off knee-bandages, which he had necessarily worn for 20 years past. He made his own case widely known by the circulation of his pamphlet (which has passed through several editions); and "numerous reports sent with thanks by strangers as well as friends," show that "the system is a great success;" and that it is so we do not doubt, for it is based on sound physiological principles. (Mr. Banting died in 1878.)

OBI, or OBEAH. See OBE, *ante.*

OBI'ON, a co. in n.w. Tennessee bordering on Kentucky; drained by the Obion river and its creeks, intersected by the Mobile and Ohio, and the Nashville and St. Louis railroads; 530 sq.m.; pop. '80, 22,923—22,807 of American birth, 4,065 colored. The surface is mostly level and fertile; there are extensive forests; Indian corn, wheat, cotton, tobacco, sweet-potatoes, and wool are the staples. Co. seat, Troy.

O'BIT (Lat. *obitus*, a "going down," "death") literally means the decease of an individual. But as a certain ecclesiastical service was fixed to be celebrated on the day of death (*in die obitus*), the name came to be applied to the service itself. Obit therefore signifies, in old church language, the service performed for the departed. It consisted, in the Roman church, of those portions of the *officium defunctorum* which are called matins and lauds, followed by a mass for the dead, chanted or occasionally read. Similar services are held on the day fo the funeral, and on the 30th day, and the anniversary; and although the name obit was primitively applied only to the first, it has come to be used of them all indiscriminately.

OBITER DICTUM, a Latin expression meaning, literally, "said by the way" and used in law to denote an expression of opinion by the court in deciding a case which does not bear upon any point directly involved in the case. Such an opinion does not have the force of a precedent, and as it is given without hearing argument is not as likely to be as well considered and precise as opinions on questions direct and not collateral. On the other hand the train of reasoning which leads to a given conclusion can often appear only by examining the side issues and using analogous principles as illustrations. The practice of courts in this respect, and especially where the right of appeal exists, is certainly freer than in the past; and though such utterances may not be authoritative they are often of practical value.

OBJECT, in the language of metaphysics, is that of which any thinking being or *subject* can become cognizant. This subject itself, however, is capable of transmutation into an object, for one may think about his thinking faculty. To constitute a metaphysical object, actual existence is not necessary; it is enough that it is conceived by the subject. Nevertheless, it is customary to employ the term objective as synonymous with real, so that a thing is said to be "objectively" considered when regarded in itself, and according to its nature and properties, and to be "subjectively" considered, when it is presented in its relation to us, or as it shapes itself in our apprehension. Skepticism denies the possibility of objective knowledge; i.e., it denies that we can ever become certain that our cognition of an object corresponds with the actual nature of that object. The verbal antithesis of objective and subjective representation is also largely employed in the fine arts, but even here, though the terms may be convenient, the difference expressed by them is only one of degree, and not of kind. When a poem or a novel, for example, obtrudes the peculiar genius of the author at the expense of a clear and distinct representation of the incident and character appropriate to itself, we say it is a subjective work; when, on the contrary, the personality of the author retires into the background, or disappears altogether, we call it objective. The poems of Shelley and Byron; the novels of Jean Paul Richter, Bulwer Lytton, and Victor Hugo; and the paintings of the preraphaelites belong essentially to the former class; the dramas of Shakespeare, the novels of Scott, and the poems of Goethe to the latter.

OBJECT-GLASS, the glass in a telescope (q.v.) or microscope (q.v.), which is placed at the end of the tube nearest the object, and first receives the rays of light reflected from it.

OBLATES (Lat. *oblatus, oblata,* "offered up"), the name of a class of religious bodies in the Roman Catholic church, which differ from the religious orders strictly so called, in not being bound by the solemn vows of the religious profession. The institute of oblates was one of the many reforms introduced in the diocese of Milan by St. Charles Borromeo, toward the close of the 16th century. The members consisted of secular priests who lived in community, and were merely bound by a promise to the bishop to devote themselves to any service which he should consider desirable for the interest of religion. St. Charles made use of their services chiefly in the wild and inaccessible

Alpine districts of his diocese. This institute still exists, and has been recently introduced into England. Still more modern are the "oblates of the blessed virgin Mary," a body of French origin, which arose in the present century, and has been very widely extended; and whose chief object is to assist the parochial clergy, by holding missions for the religious instruction of the people in any district to which they may be invited. This body also has been established in England and in Ireland. Other similar institutes might be enumerated, but the constitution of all is nearly the same. There is also a female institute of oblates, which was established in Rome, about 1440, by St. Francisca of Rome, and which consists of ladies associated for charitable and religious objects, and living in community, but bound only by promise, and not by vow.

OBLIGATION is a term used in Scotch law to denote the binding effect of any legal contract, and is often used synonymously with contract or promise. An obligation is said to be pure when it may be instantly demanded (called in England an absolute contract). An obligation is conditional when it depends for its legal effect on some events which may or may not happen. Obligations are also divided into verbal and written.

OBLIGATION OF CONTRACTS, the legal bond which demands that the contracting parties shall carry out their agreement, and including the right to enforce the contract by legal procedure. This extension of the word obligation to include the legal effect and remedy is important, and upon the subject the United States supreme court has said that "the laws which exist at the time and place of making the contract and where it is to be performed enter into and form a part of it. This embraces alike those which affect its validity, construction, discharge, and enforcement." In the United States constitution, art. I. sec. 10, is found this provision: "No state shall pass . . . any bill of attainder, *ex post facto* law, or any law impairing the obligation of contracts." The questions at once arise: What are the obligations of a contract; to what contracts does the prohibition apply, and what laws are of such a nature as to violate that prohibition? The first question is answered in the definition given above, and it should be added that the legal bond is derived from those laws only which were in existence at the time of the contract and thus supposed to be in the contemplation of the parties. As to the second, all contracts are embraced within the meaning of the law, if they respect rights or claims which could be brought before a court of law or equity, whether they are expressed or implied, executed or executory. Conveyances, statutory grants, and private charters issued by a state undoubtedly come within the prohibition. Against this the states have protested, but in the great Dartmouth college case the supreme court decided that a private charter is a contract between the state and the corporation, and cannot be repealed or impaired by subsequent legislation, and that such collateral stipulations as exemption from taxation are of the essence of the contract. This decision has been many times reaffirmed but is still doubted by many eminent lawyers on the ground that a state cannot sell by contract its sovereign functions. Municipal corporations have no such immunity as to their charters, as they are political in their nature. The contract of marriage has been held not to be of such a nature as to create obligations in the sense used in the constitution, but on the other hand it has been said that a law creating new grounds for the divorce of parties married before its passage would impair the obligation of the marriage contract and would therefore be unconstitutional. As to remedies for violation of contract obligations, it is not considered that the state impairs the obligation by changing the nature and extent of the relief offered, or by varying the time and mode in which these remedies may be pursued, or by barring all relief after a prescribed time. The case would be different were all remedies to be abolished. The right of the state to pass regulations for preserving public order, health, and morality is not to be restrained by a forced interpretation of the clause of the constitution under discussion. The right of a state legislature to forever exempt from taxation any property, and thus to bind its successors and, as it were, compromise the sovereignty of the state, is not yet fully settled; but the prevailing doctrine seems to be that such exemption may be made for good or valuable consideration, as all property rights are subject to the state powers of taxation and eminent domain. Congress has been given the power of passing general bankrupt laws, but this power is not exclusive; such laws, however, passed in aid of debtors, as stay laws, exemption laws, or statutes of limitation, conflict with the prohibition of impairment of obligations when they are so framed as to act retrospectively. Licenses, public offices, and permission by statute to do certain acts, as to sue the state, are not in their nature contracts; no consideration exists, and the grant may be repealed without impairing any contract obligation. Thus it has repeatedly been held that license to establish a lottery or to carry on a dangerous manufacture may at any time be revoked. It will be noticed that the constitution does not extend the prohibition of impairment to congress as well as to the states, and however opposed to common honesty and public policy such an act would be, there is little doubt that congress has the legal power to pass such laws.

OBLIGA'TO, in music. When a musical composition is constructed in more than one part, any part is said to be obligato which is not merely employed to strengthen the others, but is necessary to the melodic perfection of the whole. An accompaniment is said to be obligato which does not consist of mere chords, but has its own melody.

O'BOE. See HAUTBOY.

OB'OLUS (Gr. *obolos* or *obelos*, a spit), the smallest of the four common Greek coins and weights, was originally, as is generally supposed, a small piece of iron or copper, similar in form to the head of a spit, or spear head, whence its name. In this form it was used as a coin, and a handful of "oboli" was equivalent to a drachma (q.v.). It was subsequently coined of silver, and in the ordinary round form, but still retained its original name; its value, both as a coin and a weight, was now fixed as the $\frac{1}{6}$ part of a drachma, so that in the Attic system it was equivalent to $1\frac{1}{8}$d. and $15\frac{2}{5}$ Troy grains respectively; while the Æginetan obolus was worth $2\frac{3}{4}$d. as a coin, and $25\frac{3}{5}$ Troy grains as a weight. Multiples and submultiples of this coin were also used, and pieces of the value of 5, 4, 3, 2, $1\frac{1}{2}$ oboli, and of $\frac{3}{4}$, $\frac{1}{2}$, $\frac{1}{8}$, and $\frac{1}{4}$ of an obolus respectively, are to be found in collections of coins.

OB'OLUS, in natural history. See INVERTEBRATE ANIMALS, sub-kingdom mollusca, division A; class III. family 10.

OBOOKI'AH, HENRY, b. in the island of Hawaii, about 1795. In his childhood in a civil war his parents were killed before his eyes. Taking his infant brother upon his back, and attempting to escape, his brother was pierced through with a spear, and he was made prisoner and taken to the house of the man who had killed his parents. His uncle, the high priest of the island, found him here and took him home. He was kindly treated by his uncle, but he was unhappy, often weeping day and night. He gladly in 1805 embarked to come to the United States with capt. Brintnal of New Haven, Conn., and for a while resided with the captain. He attended church, and showed a great desire for instruction, lingering about the college buildings. Finding the desire unattained, and thinking of the students there who were enriching their minds with the treasures which were inaccessible to him, he sat down weeping on the threshold. The Rev. Edwin W. Dwight, a resident graduate, found him there, and taking him to his house, gave him instruction. Samuel J. Mills visiting New Haven soon became acquainted with him, and Henry expressed a desire to "learn to read the Bible, and go back to his native islands and tell the people of God. Mills took Henry to his father's house in Torringford, where he rapidly improved in religious and secular knowledge. Afterward he accompanied Mr. Mills to Andover, where he spent two years. By invitation of James Morris, he spent the winter of 1813 at the Litchfield grammar school. In the autumn of 1814 by advice of friends he placed himself under the care of the North consociation (Congregational) of Litchfield co., for the direction of his studies; and Nov. 15, 1815, he was received under the care of the American board. A foreign mission school having been established at Cornwall, Conn., Obookiah was placed there to be educated. But on Feb. 17, 1818, he was stricken with fever, and soon died. But he had not lived in vain. His earnest desire for an education, shown in New Haven, led to the establishment of the Cornwall school, and the education of several of his countrymen, and to the awakening of the Christian community to a deep interest for the Sandwich islands; to which a mission was commenced soon after his death.

O'BRIEN, a co. in n.w. Iowa, drained by Little Sioux river, and Willow creek; on the Chicago, Milwaukee, and St. Paul railroad; 576 sq.m.; pop. '80, 4,155—3,626 of American birth. The surface is mostly prairie, and the soil fertile. The principal productions are corn, wheat, oats, and barley. Co. seat, Primgar.

O'BRIEN, FITZ-JAMES, 1829–62; b. Ireland; emigrated to America in 1850, and, in April 1861, joined the New York 7th regiment. In the following January he was placed on the staff of gen. F. W. Lander, was wounded in a skirmish Feb. 16, 1862, and died from the effects of a surgical operation. He was a contributor in prose and verse to the *Atlantic Monthly*. He was happy in his choice of themes, especially for his poetical work, and he gave them noble treatment, vigorous but refined. He was a brave soldier. He is called the ablest of those of the New York Bohemians, from 1850 to 1862, who are now dead. He was a member of that literary coterie to which Charles G. Halpine, E. C. Stedman, Walt Whitman, and T. B. Aldrich belonged, and in a publication of the present year entitled *Life, Poems, and Stories of Fitz-James O'Brien*, edited by William Winter, who knew him well, are included his stories, most distinguished for imaginative ability and literary art, *The Diamond Lens* and the *Golden Ingot*.

O'BRIEN, JEREMIAH, 1740–1818; b. Ireland; came to this country and settled in Maine; in 1775, with only a few assistants, struck the first hostile blow in the American waters, capturing the Margaretta, a British armed vessel, for which act he was appointed capt. of privateers. Soon afterwards he captured other English vessels, and was commissioned capt. in the state navy, but finally was made prisoner, and confined in the prison-ship Jersey for six months, then sent to England and placed in Mill prison, but a year later escaped, and returned to Maine. He held the office of collector at Machias, at which place he died.

O'BRIEN, WILLIAM SMITH, b. in 1803, was the second son of the late sir Edward O'Brien, bart. of Dromoland, in the county of Clare, Ireland, and uncle of the present lord Inchiquin; that ancient barony having recently passed to the Dromoland O'Briens on the failure of the elder branch. William S. O'Brien was educated at Harrow school,

whence he passed to Trinity college, Cambridge. He entered parliament for the borough of Ennis in 1826, and was a warm supporter of Catholic emancipation. In 1835 he was returned on advanced liberal principles for the county of Limerick, and for several years strongly advocated the claims of Ireland to a strictly equal justice with England, in legislative as well as executive measures. Professing his inability to effect this in the united legislature, and having embroiled himself with the speaker by refusing to serve on committees (for which refusal he was committed to prison in the house by the speaker's order), he withdrew from attendance in parliament in 1841, and joined actively with Daniel O'Connell (q.v.) in the agitation for a repeal of the legislative union between England and Ireland. In the progress of that agitation, a division having arisen on the question of *moral* as against *physical force* between O'Connell and the party known as "young Ireland," O'Brien sided with the latter; and when the political crisis of 1848 eventuated in a recourse to arms, he took part in an attempt at rebellion in the s. of Ireland, which in a few days came to an almost ludicrous conclusion. He was in consequence arrested, and, having been convicted, was sentenced to death. The sentence, however, was commuted to transportation for life; and after the restoration of tranquillity in the public mind in Ireland, he, in common with the other political exiles, was permitted to return to his native country. From that date (1856) he spent much of his time in foreign travel; and although he wrote more than once in terms of strong disapproval of the existing state of things, he invariably abstained from all active share in the political proceedings of any party. He died June, 1864.

OBSCENE PRINTS, BOOKS, or **PICTURES,** exhibited in public render the person so doing liable to be indicted for a misdemeanor. Persons exposing them in streets, roads, or public places, are also liable to be punished as rogues and vagabonds with hard labor. An important change in the law was effected by lord Campbell's act (20 and 21 Vict. c. 83), which was passed to suppress the traffic in obscene books, pictures, prints, and other articles. Any two justices of the peace, or any police magistrate, upon complaint made before him on oath that such books, etc., are kept in any house, shop, room, or other place, for the purpose of sale, or distribution, or exhibition for gain or on hire, and that such things have been sold, etc., may authorize a constable to enter in the day-time, and, if necessary, use force by breaking open doors, or otherwise to search for and seize such books, etc., and carry them before the magistrate or justices, who may, after giving due notice to the occupier of the house, and being satisfied as to the nature and object of keeping the articles, cause them to be destroyed.

OBSCENE PRINTS, BOOKS, or PICTURES (*ante*). By U. S. revised statutes, sec. 2,491, all persons are prohibited from importing into the United States from any foreign country any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other representation, figure, or image, on or of paper or other material, or any instrument or drug for any immoral purpose. No invoice or package containing such articles shall be admitted at the custom house. Any judge of any U. S. district or circuit court, before whom complaint in writing is made upon knowledge or belief, and if upon belief, setting forth the grounds of such belief, supported by complainants' oath, may issue a warrant to any marshal or deputy marshal to search for and seize such immoral articles, and to make return so that they may be condemned and destroyed. The proceedings, as in other cases of municipal seizure, are subject to appeal or writ of error. It was held in *The U. S.* vs. *One case of Stereoscopic Slides*, Sprague, 407, that where an invoice contains any immoral articles, the whole is forfeited. By sec. 3,878, obscene publications, etc., are excluded from the mails. By sec. 3,893 any person who shall knowingly deposit in or take out from the mails such things for the purpose of circulation or distribution, shall be guilty of a misdemeanor, and for each offense be fined not less than $100 or more than $5,000, or imprisoned not less than one year or more than 10 years, or both at the discretion of the court. The prohibition of these statutes is against every article or thing intended or adapted to any obscene, indecent, or immoral use. By sec. 5,389, every person in the district of Columbia, or any of the territories, or elsewhere within the United States jurisdiction, who sells, lends or gives away, or in any manner exhibits or publishes or offers to publish any obscene publication etc., shall be punished with hard labor in the penitentiary for not less than 6 months, or more than 5 years for each offense, or shall be fined not less than $100 or more than $2,000 with costs. By sec. 1785, any officer, agent, or employee of the United States who violates laws against obscene literature etc., is guilty of misdemeanor, and for each offense, shall be fined not less than $100, nor more than $5,000, or shall be imprisoned at hard labor for not less than one year, nor more than 10 years or both. See VICE, SOCIETY FOR THE SUPPRESSION OF.

OBSCURAN'TISTS, the name given, originally in derision, to a party who are supposed to look with dislike and apprehension on the progress of knowledge, and to regard its general diffusion among men, taken as they are ordinarily found, as prejudicial to their religious welfare, and possibly injurious to their material interests. Of those who avow such a doctrine, and have written to explain and defend it, it is only just to say that they profess earnestly to desire the progress of all true knowledge as a thing good in itself; but they regard the attempt to diffuse it among men, indiscriminately, as perilous,

and often hurtful, by producing presumption and discontent. They profess but to reduce to practice the motto—

A little learning is a dangerous thing.

It cannot be doubted, however, that there are fanatics of ignorance as well as fanatics of science.

OBSEQUIES. See FUNERAL RITES, *ante*.

OBSERVANTISTS, or OBSERVANT FRANCISCANS, Under the head FRANCISCANS (q.v.) has been detailed the earlier history of the controversies in that order on the interpretation of the original rule and practice established by St. Francis for the brethren, and of the separate organization of the two parties at the time of Leo X. The advocates of the primitive rigor were called *Observantes*, or *Strictioris Observantiæ*, but both bodies were still reputed subject, although each free to practice its own rule in its own separate houses, to the general administrator of the order, who, as the rigorists were by far the more numerous, was a member of that school. By degrees, a second reform arose among a party in the order, whose zeal the rigor of the observantists was insufficient to satisfy, and Clement VII. permitted two Spanish friars, Stephen Molena and Martin Guzman, to carry out in Spain these views in a distinct branch of the order, who take the name of *reformati*, or reformed. This body has in later times been incorporated with the observantists under one head. Before the French revolution, they are said to have numbered above 70,000, distributed over more than 3,000 convents. Since that time, their number has, of course, been much diminished; but they still are a very numerous and widespread body, as well in Europe as in the new world, and in the missionary districts of the east. In Ireland and England, and for a considerable time in Scotland, they maintained themselves throughout all the rigor of the penal times. Several communities are still found in the two first-named kingdoms.

OBSERVATION AND EXPERIMENT are the leading features of modern science, as contrasted with the philosphy of the ancients. They are indispensable as the bases of all human knowledge, and no true philosophy has ever made progress without them, either consciously or unconsciously exercised. Thus, by Socrates, Plato, and Aristotle, no less than by Archimedes and the ancient astronomers, observation and experiment are extensively though not prominently or always obviously employed; and it was by losing this clue to the spirit of their master's teaching, that the later disciples in these schools of philosophy missed the path of real progress in the advancement of knowledge. It was in the latter half of the 16th c. that the minds of philosophers were first *consciously* awakened to the importance of observation and experiment, as opposed to authority and abstract reasoning. This result was first occasioned by the discoveries and controversies of Galileo in Florence; and to the same end were contributed the simultaneous offorts of a number of philosophers whose minds were turned in the same direction—Tycho Brahe in Holland, Kepler in Germany, William Gilbert in England, who were shortly afterwards followed by a crowd of kindred spirits. The powerful mind of Francis Bacon lent itself to describe the newly awakened spirit of scientific investigation, and though he ignored or affected to despise the results achieved by the great philosophers just mentioned, he learned from them enough to lay the foundation of a philosophy of inductive science, which, if we look at the course of scientific progress since his day, seems to have been almost prophetic. The difference between observation and experiment may be said to consist in this, that by observation we note and record the phenomena of nature as they are presented to us in her ordinary course; whereas by experiment we note phenomena presented under circumstances artificially arranged for the purpose. Experiment is thus the more powerful engine for discovery, since one judiciously conducted experiment may provide the data which could only result from a long course of observations.

OBSERVATORY, an institution supplied with instruments for the regular observation of natural phenomena, whether astronomical, meteorological, or magnetical. In some observatories all three classes of observation are carried on, but in most cases special attention is paid to astronomy alone, and only such meteorological observations are taken as are required for the calculation of the effect of atmospheric refraction on the position of a heavenly body; there are, however, a few observatories which are devoted solely to meteorologieal or magnetical observations. Confining our attention to astronomical observatories, it will be convenient to divide them into two classes—public and private observatories—the former being devoted to those observations which from their nature require to be continued on the same system for long periods of time, whilst the latter are usually founded for some special object, which may be attained with a comparatively small expenditure of time and labor.

The most important work which is carried out in public observatories is the determination of the movements of the sun, moon, and planets among the stars; and as a corollary to this, the relative positions of the stars to which the other heavenly bodies are referred. In early times the Greek astronomers fixed these positions by means of armillary spheres and astrolabes, having concentric graduated circles, on which the latitudes and longitudes could be read off, when a pair of sights was pointed to the heavenly body. Ptolemy made use of a quadrant, with which he measured zenith distances on the meridian; and many centuries after, Tycho Brahé converted this form of instrument

into an altazimuth by mounting it on a vertical axis in connection with a horizontal or azimuth circle. With this instrument Tycho Brahé made a long series of observations of the altitudes and azimuths of the heavenly bodies at the observatory which the king of Denmark erected for him, and he also measured with great assiduity their angular distances from each other by means of a sextant, a method of observation which Flamsteed afterward employed with a much improved form of the instrument, and which is now extensively used with the reflecting sextant, for finding the longitude at sea. It was not till the middle of the last c., that the improvement of the clock by Graham enabled astronomers to rely on it for the determination of right ascensions by the times of passage across the meridian, instead of by measuring them with a graduated circle. The quadrant was then fixed in the meridian, and being attached to a massive wall, its dimensions were increased, and greater accuracy thereby secured in the determination of meridian zenith distances. Two such instruments pointing respectively n. and s. were erected at the royal observatory, Greenwich, and used by Bradley and his successors from 1750 till they were displaced by the mural circle (see CIRCLE, MURAL), an instrument vastly superior in principle, since the troublesome errors of centering of the quadrant were got rid of by combining the readings of opposite parts of a graduated circle, whilst the effect of division errors was much reduced by taking the mean of the readings at 6 or 8 equidistant points of the circle. At the same time, the accuracy of the readings was greatly increased by the invention of the micrometer-microscope, which made it possible to measure spaces to $\frac{1}{100000}$ of an inch. Neither the quadrant nor the mural circle, however, could be relied upon for accurate motion in the plane of the meridian, but Römer remedied this defect by inventing a separate instrument, the transit (q.v), which enabled astronomers to observe the times of meridian passage or transit with great accuracy, and thus to determine the differences of right ascension of the heavenly bodies by means of the apparent diurnal movement. With the transit and quadrant Bradley commenced that series of observations of the positions of the sun, moon, and planets, and of stars for reference, which have been continued ever since at Greenwich, and on which, in combination with less extensive series at Paris and Königsberg, all our tables of the motions of the heavenly bodies are founded. In modern observatories, the transit and mural circle are combined into one instrument, the transit-circle, a change which has been rendered possible chiefly by the improvement in graduated circles since the invention of Troughton's dividing engine, the unwieldy size of the old quadrants and mural circles necessitating an attachment to a massive wall. Although Reichenbach made transit-circles at the beginning of this c. for several foreign observatories, including that of Dorpat, the lightness of their structure and their want of stability prevented their being introduced generally, and the mural circle held its place in the principal observatories till sir George Airy designed the Greenwich transit-circle in 1851, an instrument of a most massive character, which has served as model for nearly all that have been constructed in recent years. The main features of the modern transit-circle are: (1) that it is not reversible, its collimation error being determined by means of two collimators, or reversed telescopes pointing at each other and at the transit telescope, n. and s. respectively; (2) that a spirit-level is not used, the level error being found by means of the reflection of the wires from the horizontal surface of mercury. These two negative characteristics, while admitting of great massiveness in construction (the Greenwich instrument weighs more than a ton), have removed three troublesome sources of error—inequality in the pivots, lateral flexure of the telescope in the process of reversion, and the effect of currents of heated air on a spirit-level. An important auxilliary to the transit-circle is the chronograph, an American invention, which, in various forms, is now found in all well-equipped observatories, the principle in all cases being the same—viz., the registration on a revolving cylinder of paper of the times of transit across the system of spider-lines of the transit-circle, as well as of the seconds of the sidereal clock, by means of electric currents, which pass through electro-magnets, when the circuit is closed either by the observer or the clock, thus causing a momentary attraction of a piece of soft iron, and producing a corresponding mark on the paper either with a pen or a steel point. This system, while improving somewhat the accuracy of the individual observations, admits of a large number being made at intervals of two or three seconds, and leaves the observer free to make several observations of zenith distance during the passage of a star across the field of view. Allusion has been made to the importance of the sidereal clock in modern astronomy. Considerable improvements have been made in its construction since Graham's time, the original gridiron pendulum having been replaced successively by the mercurial and the zinc and steel, and the dead-beat escapement by Dennison's gravity and Airy's detached escapement. Recently an apparatus depending on the attraction of a movable magnet connected with a float in a siphon barometer has been applied by sir George Airy to the sidereal clock at Greenwich, to correct for the effect of variations in the atmospheric pressure on the motion of the pendulum. This clock is placed in a basement which is kept at a nearly uniform temperature, an important condition, which has contributed to make its performance very far superior to that of any other clock hitherto constructed, and fully equal to the requirements of the methods of observation now in use. With instruments such as have just been described, regular observations of the sun, moon, and planets, and of fundamental stars, are made at Greenwich, Paris, Washington and Oxford, supplemented at the first-named observatory by extra-meridian observations of the moon with a massive altazimuth, which can be employed when the moon is too near

new moon to be seen on the meridian in full daylight, and which is in fact used to secure an observation on every night when the moon is visible.

The observations of stars at these four observatories are directed to the most accurate determination of the places of a limited number, and the deduction of their proper motions by comparison with the results obtained by Bradley, Piazzi (with an altazimuth by Ramsden at Palermo), and Groombridge; but at other observatories differential or zone observations of large numbers of stars have been made, with the object of making a complete and tolerably accurate survey of the heavens, the rhomb or ring micrometer being used for this purpose. Among those who have devoted themselves to this work may be mentioned Lacaille at the cape of Good Hope, Lalande at Paris, Bessel at Königsberg, and Argelander at Bonn. These zone-observations are now being repeated with the transit-circle at a number of observatories, associated together for the purpose of getting far more accurate places than was possible with the equatorial. A large number of observatories, chiefly in Germany and America, are devoted to a very different class of observations—viz., differential observations with the equatorial (q.v.) of comets and small planets as referred to comparison-stars, and the search for such objects; whilst at other observatories, among which that of Pulkowa may be mentioned, the measurement of double stars with the micrometer is laid down as the chief object. Of late years two new subjects have been introduced in the routine of observatory work—photography and spectroscopy. The former was carried on for many years at Kew observatory under Mr. de la Rue's auspices, and at his private observatory at Cranford, and the work is now being continued at Greenwich: the latter has been taken up at a number of Italian observatories, and particularly at Rome by P. Secchi, and it now forms part of the regular system at Greenwich; whilst the observatories at Paris, Berlin, and Vienna are equipped for these physical observations, and in America and Australia they are vigorously carried on at several observatories—Melbourne, in particular, being provided with a four-feet equatorial reflector for this purpose, as well as for the examination of nebulæ. The most important work of an observatory, however, consists, not in making observations, which are easily multiplied, but in reducing and publishing them—a task of far greater labor, and requiring far higher qualifications. However various may be the observations, the method of eliminating their errors is the same in all cases, and similar mathematical considerations apply to their reduction, whether they be meridian observations, micrometer measures, measures of photographs, or spectroscopic observations; and it is when such treatment is required in any inquiry that it should be undertaken at a public observatory, where this rigorous method will be applied.

The work of private observatories hardly admits of being specified, though its general character has already been indicated; it may suffice to mention the observations of double stars and nebulæ by the two Herschels, Groombridge's catalogue of circumpolar stars, Smyth's double-star measures, Carrington's Redhill catalogue and solar observations, the nebular observations of Lord Rosse and Mr. Lassell, De la Rue's long series of photographs, and the spectroscopic observations of Huggin's and Lockyer.

In addition to regular astronomical observations of all kinds, national observatories are usually charged with the distribution of time signals, and the rating of chronometers for the navy—matters of great practical importance, especially in this country, where Greenwich time is communicated directly by telegraph to more than six hundred towns.

OBSIDIAN, a mineral accurately described by Pliny under the name which it still bears. It is a true kind of native glass, composed of silica (from 70 to 80 per cent), alumina, lime, soda, potash, and oxide of iron. It is hard and brittle, with remarkably vitreous luster, and perfectly conchoidal fracture, the edges of the fractures very sharp and cutting like glass. It varies from semi-transparency to translucency only on the edges. It is often black, or very dark gray; sometimes green, red, brown, striped, or spotted; and sometimes *chatoyant* or *avanturine.* It occurs in volcanic situations, and often in close connection with pumice, in roundish compact pieces, in grains, and in fibers. It is capable of being polished, but is apt to break in the process. It is made into boxes, buttons, ear-drops, and other ornamental articles; and before the uses of the metals were well known, it was employed in different parts of the world for making arrow and spear heads, knives, etc. It is found in Iceland, the Lipari isles, Vesuvius, Sardinia, Hungary, Spain, Teneriffe, Mexico, South America, Madagascar, Siberia, etc. Black obsidian was used by the ancients for making mirrors, and for this purpose was brought to Rome from Ethiopia. It was used for the same purpose in Peru and Mexico. Mirrors of black obsidian are indeed still employed by artists. Chatoyant or avanturine obsidian is very beautiful when cut and polished, and ornaments made of it are sold at a comparatively high price.

OBSTETRICS. See Midwifery, *ante.*

OBVERSE, or Face, the side of a coin or medal which contains the principal device or inscription, the other side being in contradistinction called the reverse. See Numismatics.

O'CALLAGHAN, Edmund Bayley, ll.d., b. Ireland. After studying two years at Paris he went in 1823 to Quebec; commenced the practice of medicine in 1827; became in 1836 a prominent member of the provincial parliament; in 1834–37 was editor of the *Vindicator,* the national organ at Montreal. In 1837 he removed to New York. O'C. published several works, among which the following are the most important: *History of*

New Netherlands; Jesuit Relations; *Documentary History of New York*, 4 vols.; *Documents relating to the Colonial History of New York*, 11 vols.; *Remonstrance of New Netherland; Commissary Wilson's Orderly Book; Orderly Book of General John Burgoyne; Journals of the Legislative Councils of New York*; *Voyage of George Clark to America*, with introduction and notes; *Voyages of the slavers St. John and Arms,' Journal of the Voyage of the sloop Mary from Quebec;* and many translations of manuscripts from foreign languages. He. d. 1880.

OCARINA. See page 893.

OCCAM, WILLIAM OF, surnamed *Doctor Singularis et Invincibilis*, a famous schoolman, was born in England, at the village of Ockam, in the county of Surrey, about the year 1270. We do not possess any precise or satisfactory knowledge of his early life. He is said to have been educated at Merton college, Oxford, and to have held several benefices in his native country, but soon after resigned them on entering the Franciscan order. Early in the 14th c. it is supposed he proceeded to Paris, where he attended the lectures of Duns Scotus, of whose philosophy he was afterwards the most formidable opponent. Here he soon became prominent by the boldness of his ecclesiastical views. Philippe, *le Bel*, king of France, having forbidden pope Boniface VIII. to levy contributions in his dominions, the latter, by way of retaliation, excommunicated him. Occam rushed to the defense of the monarch, and in his *Disputatio inter Clericum et Militem, super Potestate Prælatis Ecclesiæ atque Principibus Terrarum Commissa*, denies that the popes have any authority in temporal affairs, and boldly declares that all who favored such a doctrine ought to be expelled from the church as heretics. Meanwhile, from being a listener, he had become a lecturer in philosophy. The system which he advocated—for he was not properly its originator—is known by the name of *nominalism* (q.v.), but it had never before received so rigorously logical and rational a treatment; hence his epithet of *Invincibilus*. The work in which his views are set forth is entitled *Expositio Aurea, et admodum utilis super totam Artem Veterem*. It contains a series of commentaries upon the *Isagoge* of Porphyry, and on the *Categories* and *Interpretation* of Aristotle, with a special treatise headed *Tractatus Communitatum Porphyrii*, and a theological opusculum on predestination. It is intended as a demolition of the moderns—i.e., the scholastics—and shows that in their method they have completely departed from the principles and methods of the great Stagyrite, for whom, like every sound and solid thinker, he shows the deepest respect and admiration. About 1320 or 1321 he again plunged into ecclesiastical controversy. A certain Narbonese priest, having affirmed that Jesus Christ and his apostles held everything in common, and that every ecclesiastical possession is a modern abuse, was pounced upon by the inquisitors, and defended by a certain Berenger Talon, a Franciscan monk of Perpignan. But Berenger's defense of apostolical poverty was naturally enough very disagreeable to the pope, John XXII., who therefore condemned it. Berenger was, however, vigorously supported by his order, and among others by Michael de Cesena, the general-superior, Bonagratia of Bergamo, and William of Occam, who attacked the pope with great vehemence and trenchant logic. Shortly after they were arrested as favorers of heresy, and imprisoned in Avignon. But while their trial was proceeding, Michael de Cesena and Occam, knowing what little mercy or justice they had to expect from their accusers and judges, made their escape to the Mediterranean, and were received at a little distance off shore on board a galley of Ludwig, king of Bavaria, the patron of the Franciscan antipope, Peter of Corbaras, and one of the most powerful sovereigns in Europe. The remainder of Occam's life was spent at Munich, where, safe from the machinations of his enemies, he continued to assail at once the errors of papistry in religion, and of realism in philosophy. He died April 7, 1347. It is impossible to praise Occam too highly. He was the first logician, and the most rational philosopher among the whole body of schoolmen. We are often reminded by his clear and vigorous common sense and wholesome incredulity that he was the countryman of Locke and Hobbes, and that he came of a people ever noted for the solidity of their understanding. Besides the works already mentioned, Occam's principal writings are: *Dialogus in tres Partes distinctus, quarum prima de Hæreticis, secunda de Erroribus Joannis XXII., tertia de Potestate Papæ, Conciliorum et Imperatoris; Opus Nonaginta Dierum contra Errores Joannis XXII.; Compendium Errorum Joannis Papæ XXII.; Decisiones Octo Quæstionum de Potestate summi Pontificis; Super Quatuor Libros Sententiarum Subtilissimæ Quæstiones earumque Decisiones* (based on Peter the Lombard's famous *Sententiæ*, and containing nearly the entire theology of Occam. These *Decisiones* were long almost as renowned as the *Sententiæ* which gave them birth); *Antiloquium Theologicum; Summa Logices ad Adamum Major Summa Logices.*—See Luke Wadding's *Scriptores Ordinis Minorum* (1650); Cousin's *Histoire de la Philosophie* (2d ed. 1840); and B. Hauréau's *De la Philosophie Scholastique* (1848).

OCCA'SIONALISM, or the doctrine of OCCASIONAL CAUSES (see CAUSE), is the name given to the philosophical system devised by Descartes and his school, for the purpose of explaining the action of mind upon matter, or, to speak more correctly, the combined, or at least the synchronous action of both. It is a palpable fact that certain actions or modifications of the body are accompanied by corresponding acts of mind, and *vice versâ*. This fact, although it presents no difficulty to the popular conception, according to which each is supposed to act directly upon the other—body upon mind, and mind upon body—has long furnished to philosophers a subject of much speculation. But on the other hand, it is difficult to conceive the possibility of any *direct* mutual interaction of sub-

stances so dissimilar, or rather so disparate. And more than one system has been devised for the explanation of the problem, as to the relations which subsist between the mind and the body, in reference to those operations, which are clearly attributable to them both. According to Descartes and the Occasionalists, the action of the mind is not, and cannot be *the cause* of the corresponding action of the body. But they hold that whenever any action of the mind takes place, God directly produces, in connection with it, and by reason of it, a corresponding action of the body; and in like manner conversely, they explain the coincident or synchronous actions of the body and the mind. It was in opposition to this view that Leibnitz, believing the Cartesian system to be open to nearly equal difficulties with that of the direct action, devised his system of *Pre-established Harmony.* See LEIBNITZ. His real objection to the Occasionalist hypothesis is, that it supposed a perpetual action of God upon creatures, and, in fact, is but a modification of the system of "direct assistance."

OCCULTATIONS (Lat. *occultatio*, a concealment) are neither more nor less than "eclipses;" but the latter term is confined by usage to the obscuration of the sun by the moon, and of the moon by the earth's shadow, while the former is restricted to the eclipses of stars or planets by the moon. Occultations are phenomena of frequent occurrence; they are confined to a belt of the heavens about 10° 17½′ wide, situated parallel to, and on both sides of the equinoxial, and extending to equal distances n. and s. of it, being the belt within which the moon's orbit lies. These phenomena serve as data for the measurement of the moon's parallax; and they are also occasionally employed in the calculation of longitudes. As the moon moves in her orbit from w. to e., the occultation of a star is made at the moon's eastern limb, and the star emerges on the western limb. When a star is occulted by the dark limb of the moon (a phenomenon which can only occur between new moon and full moon), it appears to an observer as if it were suddenly extinguished, and this appearance is most deceptive when the moon is only a few days old. When an occultation occurs between full moon and new moon, the reappearance of the star at the outer edge of the dark limb produces an equally startling effect. "It has often been remarked," says Herschel, "that when a star is being occulted by the moon, it appears to advance actually *upon* and *within* the edge of the disk before it disappears, and that sometimes to a considerable depth." This phenomenon he considers to be an optical illusion, though he admits the possibility of its being caused by the existence of deep fissures in the moon's substance. Occultations of stars by planets and their satellites are of rarer occurrence than lunar occultations, and still more unfrequent are the occultations of one planet by another. Occultations are calculated in the same way as eclipses, but the calculation is simplified in the case of the fixed stars, on account of their having neither sensible motion, semi-diameter, nor parallax.

OCCULTISM. See page 893.

OCCUM, or OCCOM, SAMSON; an American Indian preacher; 1723–97; b. Conn.; converted at the age of 17, and soon expressed a desire to become the teacher of his tribe; educated for the ministry among his countrymen in a private school under the care of the rev. Eleazer Wheelock at Lebanon. This school gradually became a seminary for the education of Indians and of missionaries to the Indians, and was called Moor's charity school. It was opened as a missionary school in 1748, but not completely established until 1754. Here Brant, the famous Mohawk chief, was educated, having been sent there with others of his tribe through the influence of sir William Johnson, an active friend and patron of the school. After a four years' training in the school, Occum in 1748 taught a school in New London, but soon removed to Montauk, L. I., where he taught a school among the Indians for 10 years, being at the same time their religious teacher, and preaching to the Skenecock or Yenecock Indians, 30 m. distant. In a revival among the Montauks many became Christians. Occum was ordained by the Suffolk presbytery Aug. 29, 1759, and was a regular member of the presbytery from that time. In 1766 he accompanied the rev. Mr. Whitaker of Norwich to England and Scotland to solicit funds for the support and enlargement of the school. Great interest was excited, and the houses where he preached were thronged. While in England he preached between three and four hundred sermons. Donations were obtained amounting to £12,000, nearly all of which was invested in British funds, the income to be applied to the objects of the school. It was soon transferred to Hanover, N. H., and became Dartmouth college. After his return Occum preached to his countrymen in the region of New London, and sometimes was employed in missionary labors among distant Indians. In 1786 he removed to Brothertown, near Utica, N. Y., where was the home of the Stockbridge Indians, who were of the Mohegan root. Some of the Mohegans and other Indians of Connecticut, Long Island and Rhode Island accompanied Occum. They obtained a tract of land from the Oneidas. From this they removed to Michigan, and were merged in the Stockbridge tribe. Occum wrote an account of the Montauk Indians which he preserved in manuscript in the *Historical Collections.* He published a sermon at the execution of Moses Paul, an Indian, at New Haven.

OCCUPANCY, in law, the taking possession of an unappropriated corporeal thing, with the intention of becoming its owner. This mode of acquiring property came to the common from the Roman law, which considered occupancy a mode of acquiring property belonging to no one, but subject to appropriation by the first comer. Instances are uninhabited lands, which belong to the discoverer. The finder of unclaimed lost goods

has a title to them by occupancy, and so has the captor of beasts of a wild nature, so long as he keeps possession of them, but there can be no complete property in them till they are domesticated; and if they make their escape, with no intention of coming back, *animus revertendi*, the ownership of the original owner ceases, and their next captor acquires a title in them by occupancy. But if they be once domesticated the title by occupation becomes indefeasible. The owner of property by accession acquires his title by occupancy, and so does the owner of goods obtained by confusion; it being held, that where a person with fraudulent intent mixes his property indistinguishably with that of another, the latter is not compelled to distinguish his property from that of the former, but is entitled to the ownership of the whole, and he acquires such ownership by occupancy. Blackstone refers the title to literary property to the same head of occupancy, and here also belongs the title to trade marks, ownership of which is acquired by a person using them to indicate his ownership of certain articles, or certain business. Another instance of title to personal property obtained by occupancy, occurs in the case of property acquired from an enemy in time of war. By the law of nations, property captured from an enemy vests in the government or sovereign of the state of which the captor is a subject; but the captors are generally allowed a part or the whole of the property captured. A good title to property captured on land is acquired by occupancy without the intervention of a court; but in the case of prizes acquired at sea, judgment must be rendered by a prize court of competent jurisdiction. The English method of distributing *booty*, i.e., property captured on land, is by grant from trustees appointed by the crown, and whose acts of distribution are subject to its assent. Instances of the acquisition of a title to land by occupancy are more rare. Land left bare by the sea or a lake, or deposited by a river, is acquired by occupancy. Another instance, at the common law, was where an estate was limited to one person during the life of another person, and the former died; there was then no person to whom the estate could pass. The executor could not take it, for it was not personal property; nor the heir, because it was not a fee; nor the original grantor, because he could not take back his own grant. Any person, therefore, could come in and take possession; and the person so acquiring possession was known as the "general occupant." The common law rule has been changed in many of the states, and in some the residue of the estate goes to the executor as personal property. Where the limitation was to one person and his heirs, during the life of another, and the former person dies, the residue goes to his heirs, not as heirs, because the estate is not one of inheritance, but as "special occupants" named in the grant. The general theory of title by occupation has long been of little importance. While this country was a colony of Great Britain, the ownership of land was held to be vested in the crown, and individual titles to land were derived from the crown. Since the separation of the colonies from Great Britain, titles are derived from the grant of the United States or the individual states. The *occupatio*, or occupation, of the Roman law, was the same thing as occupancy.

OCEAN, a term which, like SEA, in its general acceptation, denotes the body of salt water that separates continent from continent, and is the receptacle for the waters of rivers. The surface of the ocean is about three-fifths of the whole surface of the earth. Although no portion of it is completely detached from the rest, the intervening continents and islands mark it off into divisions, which geographers have distinguished by special names: the *Atlantic ocean* (q.v.), between America and Europe and Africa; the *Pacific ocean* (q.v.), between America and Asia; the *Indian ocean* (q.v.), lying s. of Asia, and limited on the e. and w. by Australasia and South Africa; the *Arctic ocean* (q.v.), surrounding the north pole; and the *Antarctic ocean* (q.v.), surrounding the south pole. The general features and characteristics of the ocean will be described under SEA.

OCEAN, a co. in s.e. New Jersey, bounded on the e. by the Atlantic ocean, watered by Cedar creek and Tom's river, traversed by the New Jersey Southern and Tuckerton railroads; about 650 sq.m.; pop, '80, 14,455—13,963 of American birth. The surface is level, and heavily wooded, and the soil sandy. The principal productions are corn, potatoes, cranberries, and lumber. Co. seat, Tom's River.

OCEAN, N. J. See page 893.

OCEA'NA, a co. in w. Michigan, bounded on the w. by lake Michigan; drained by White river; on the Chicago and West Michigan railroad; 550 sq.m.; pop. '80, 11,699—9,784 of American birth. The surface is rolling or level, and heavily wooded, and the soil fertile. The principal productions are corn, wheat, potatoes, and oats. Co. seat, Hart.

OCEAN'IA, the name given to the fifth division of the globe, comprising all the islands which intervene between the south-eastern shores of the continent of Asia and the western shores of the American continent. It naturally divides itself into three great sections—Malay Archipelego (q.v.), Australasia (q.v.), or Melanesia and Polynesia (q.v.).

OCEAN'ICA. (See OCEANIA, *ante*.)

OCEAN'US, in mythology, the eldest of the Titans, son of Ouranos and Gê, father, by his sister Tethys, of the 3,000 Oceanides, or ocean nymphs. He was the god of the ocean-stream which surrounded the plain of earth. His palace, according to Homer, was in the west. Æschylus represents him as living in a cave under ocean, from which he comes on a hippogriff to condole with Prometheus.

OCEL'LUS, LUCA'NUS, b. Lucania, Italy, 5th c. B.C.; a pupil of Pythagoras. He wrote a number of philosophical treatises, of which only one, *on the nature of the universe*, has been preserved. In this he maintains the eternity of the human race, and of the universe. Diogenes Laërtius cites a letter from Archytas to Plato, mentioning four treatises of Ocellus which the former had sent to Plato; the answer of Plato acknowledges the receipt of the books, of which he expresses a high opinion. The subjects of the four works were on *law*, *piety*, the nature of the *universe*, and *kingly rule*. The extant treatise is written in the Ionic dialect, while Doric was the dialect prevailing in Lucania. The genuineness of the work has been questioned on this ground. The weight of opinion seems to be in favor of the supposition of Rudolphi, that the work was originally written in Doric, but that the Ionic forms were introduced by successive copyists and grammarians. The fragments of the same treatise found in Stobæus, are written in Doric. There is an English translation by Thomas Taylor (1837).

OCELOT, the name of several species of *felidæ*, natives of the tropical parts of South America, allied to the leopard by flexibility of body, length of tail, and other characters, but of much smaller size. They are usually included in the genus *leopardus* by those who divide the felidæ into a number of genera. They are inhabitants of forests, and very expert in climbing trees. Their prey consists in great part of birds. They are beautifully marked and colored. The best-known species, or COMMON ocelot (*felis pardalis*), a native of the warm parts of America, from Mexico to Brazil, is from 2 ft. 9 in. to 4 ft. long, exclusive of the tail, which is from 11 to 15 ins., and nearly of uniform thickness. The ears are thin, short, and pointed. The muzzle is rather elongated. The colors vary considerably, but the ground tint is always a rich red or tawny color, blending finely with the dark brown on the margins of the open spots, of which there are chains along the sides; the head, neck, and legs being also variously spotted or barred with dark brown or black. The ocelot is easily tamed and is very gentle and playful, but excessively mischievious. It may be fed on porridge and milk, or other such food, and is said to be then more gentle than if permitted to indulge in carnivorous appetites. Very similar to the common ocelot are several other American species, as the LINKED OCELOT (*felis catenata*), the LONG-TAILED OCELOT (*felis macrourus*), the CHATI (*felis mitis*), etc. The similarity extends to habits and disposition as well as form.

O'CHERS, the name usually applied to clays colored with the oxides of iron in various proportions, giving to the clay a lighter or deeper color. Strictly speaking the term belongs only to a combination of peroxide of iron with water. From many mines large quantities of water charged with ferruginous mud are being continually pumped up, and from this water the colored mud or ocher settles In this way large quantities are procured from the tin mines of Cornwall, and the lead and copper mines of north Wales and the isle of Man. Ochers occur also ready formed, in beds several feet thick, in the various geological formations, and are occasionally worked, as at Shotover hill, Oxford, in Holland, and many other places in Europe and America. Very remarkable beds are worked in Canada. The ochers so obtained are either calcined for use or not, according to the tint wanted. The operation adds much to the depth of color, by increasing the degree of oxidation of the contained iron. The most remarkable varieties of ocher are the Siena earth (terra di Siena) from Italy; the so-called red chalk, with which sheep are marked; Dutch ocher; Armenian bole, or Lemnian earth; Italian rouge, and Bitry ocher. They vary in color from an Isabelline yellow, through almost every shade of brown, up to a tolerably good red. The finest kinds are used by painters, the coarsest by carpenters for marking out their work, by farmers for marking cattle, etc.

O'CHILL HILLS, a hilly range in Scotland, occupying parts of the counties of Perth, Clackmannan, Stirling, Kinross, and Fife, and extending from the vicinity of Stirling n.e. to the Firth of Tay. The range is 24 m. in length and about 12 m. in breadth. The highest summit is Bencleugh (2,352 ft.), near the s.w. extremity. The hills, which are formed chiefly of greenstone and basalt, contain silver, copper, and iron ores, and afford excellent pasturage.

OCHILTREE: co., Texas. See page 893.

OCHNA'CEÆ, a natural order of exogenous plants, containing not quite 100 known species, natives of tropical and subtropical countries. Some of them are trees, most of them under-shrubs; all are remarkable for their smoothness in all parts. Bitter and tonic qualities prevail in this order, and some species are medicinally used in their native countries. The seeds of *Gomphia jabotapita* yield an oil, which is used in salads in the West Indies and South America.

O'CHRO. See HIBISCUS.

OCKLEY, SIMON, 1678–1720; b. England; entered Queen's college, Cambridge, in 1693, and received the degree of B.D. In 1705 he was presented to the vicarage of Swavesey. He became learned in the oriental languages. From Arabic manuscripts in the Bodleian library, at Oxford, he compiled a work containing much serviceable information concerning the early conquests of the Arabs, entitled *The History of the Saracens*, beginning with the times immediately subsequent to the death of Mohammed, and concluding in the year 705, which is much esteemed as a book of reference for the student in oriental languages. Gibbon, the historian, while writing his *Decline and Fall*, consulted it with advantage, and characterized the author as "an original in every sense who had opened

his eyes," and "a learned and spirited interpreter of Arabian authorities." Disraeli says: "He was, perhaps, the first who exhibited to us other heroes than those of Rome and Greece, sages as contemplative, and a people more magnificent even than the iron masters of the world." The scholars of his time received the book with marked approbation, esteeming it "the most authentic account of the Arabian prophet yet given to the world," and in 1847 it was regarded as "the standard history of this eventful period." In 1711 he was made professor of Arabic in the university of Cambridge, and in his inaugural address he pathetically referred to his poverty. The 1st vol. of his history was published in 1708, the 2d and last in 1718, and was dated at Cambridge castle, where he was imprisoned for debt. From these circumstances the conclusion is drawn that his literary work brought him little profit, but it is also a matter of history that he had an expensive family. In Chalmers's *Biographical Dictionary* there is an interesting account of his life, by Dr. Heathcote, and about the preparation of his principal work, his own words express the difficulties encountered, when he says: "Had I not been forced to snatch everything that I have, as it were, out of fire, our Saracen history should have been ushered into the world in a different manner." A third edition with additions by Dr. Long appeared in 1757 in 2 vols., and a fourth edition revised, improved, and enlarged, in 1847. Among his most important works, in addition to sermons on *The Christian Priesthood*, and the *Necessity of Instructing Children in the Scriptures*, there were published in 1706, *Introductio ad Linguis Orientalis in qua iis Discendis via munitur et Earum usus Ostenditur;* in 1707, *The History of the present Jews Throughout the World*, translated from the Italian of Leo of Modena, a Venetian rabbi; in 1708, *The Improvement of Human Reason Exhibited in the Life of Hai Ebn Yokdhan*, from the Arabic. In 1716 he published a new translation from the Arabic version of the second *Apocryphal Book of Esdras*. His writings are distinguished for their almost perfect accuracy as well as their erudition.

OCKMUL'GEE, a river in Georgia, which rises in the northern center of the state by three branches, and after a course of 200 m. s.s.e., joins the Oconee, to form the Altamaha. It is navigable to Macon, 130 m. above its mouth.

OCO'NEE, a river of Georgia, rises in the n.e. part of the state, and flows southerly 250 m. where it unites with the Ockmulgee to form the Altamaha; it is navigable to Milledgeville, 100 miles.

OCO'NEE, a co. in n.e. central Georgia, bounded by the Oconee river on the e., and the Appalachee on the w.; pop. '80, 6,349—of American birth, 6,344; colored, 3,032. The soil is fertile, and the surface hilly; corn and cotton are the chief products. The county was formed about 1870 from the s. part of Clarke county. Co. seat, Watkinsville.

OCO'NEE, a co. in extreme n.w. South Carolina, bounded n.w. by the Chatooga, s.w. by the Tugaloo, and e. by the Kiowee rivers; intersected by the Piedmont Air Line railroad; 750 sq.m.; pop. '80, 16,255—16,049 of American birth; colored, 4,301. The surface is broken and hilly, covered in most part by pine forests; cotton, Indian corn, and pork are the staples. Gold is found in small quantities. Co. seat, Walhalla.

O'CONNELL, DANIEL, eldest son of Mr. Morgan O'Connell of Darrynane, near Cahirciveen, in the co. of Kerry, Ireland, was born Aug. 9, 1775. His family was ancient, but straightened in circumstances. O'Connell received his first education from a hedge-schoolmaster, and, after a further training under a Catholic priest in the co. of Cork, was sent in 1790 to the English college at St. Omer. His school reputation was very high; but he was driven home prematurely by the outbreak of the revolution, and in 1794 entered as a law-student at Lincoln's inn. In 1798 he was called to the bar; and it was the boast of his later career as an advocate of the repeal of the Union with England, that his first public speech was delivered at a meeting in Dublin, convened for the purpose of protesting against that projected measure. He devoted himself assiduously, however, to the practice of his profession, in which he rose steadily. By degrees, the Roman Catholic party having begun to rally from the prostration into which they had been thrown through the rebellion of 1798 and its consequences, O'Connell was drawn into public political life. In all the meetings of his co-religionists for the prosecution of their claims, he took a part, and his unquestioned ability soon made him a leader. He was an active member of all the successive associations which, under the various names of "Catholic board," "Catholic committee," "Catholic association," etc., were organized for the purpose of procuring the repeal of the civil disabilities of the Catholic body. Of the Catholic association he was himself the originator; and although his supremacy in its councils was occasionally challenged by some aspiring associates, he coutinued all but supreme down to its final dissolution. By means of this association, and the "Catholic rent" which it was enabled to raise, he created so formidable an organization throughout Ireland that it gradually became apparent that the desired measure of relief could not longer be safely withheld; and the crisis was precipitated by the bold expedient adopted by O'Connell, of procuring himself to be elected member of parliament for Clare in 1828, notwithstanding his well-known legal incapacity to serve in parliament, in consequence of his being obliged to refuse the prescribed oaths of abjuration and supremacy, which then formed the ground of the exclusion of Roman Catholics from the legislature. This decisive step towards the settlement of the question, although it failed.

to procure for O'Connell admission to parliament, led to discussions within the House, and to agitations outside, so formidable, that in the beginning of the year 1829, the duke of Wellington and sir Robert Peel found it expedient to give way: and, deserting their former party, they introduced and carried through, in the spring of that year, the well-known measure of Catholic emancipation. O'Connell was at once re-elected, and took his seat for Clare, and from that date until his death continued to sit in parliament. He was elected for his native county in 1830, for the city of Dublin in 1836, for the town of Kilkenny in 1836 (having been unseated for Dublin on petition), for Dublin again in 1837, and for the co. of Cork in 1841. During all these years, having entirely relinquished his practice for the purpose of devoting himself to public affairs, he received, by means of an organized annual subsidy, a large yearly income from the voluntary contributions of the people, by whom he was idolized as their "liberator;" and who joined with him in all the successive agitations against the act of Union, against the Protestant church establishment, and in favor of reform, in which he engaged. In the progress of more than one of these political agitations, his associations were oppressed by the government; and the agitation for a repeal of the Union, recommenced in 1841 and carried on by "monster meetings" throughout Ireland, at which O'Connell himself was the chief speaker, assumed proportions so formidable, that he, in common with several others, was indicted for a seditious conspiracy, and after a long and memorable trial, was convicted, and sentenced to a year's imprisonment, with a fine of £2,000. This judgment was reversed by the House of lords; and O'Connell, on his discharge, resumed his career; but his health had suffered from confinement, and still more from dissensions and opposition in the councils of his party; and as, on the return of the whigs to power in 1846, he consented to support their government, the malcontents of the repeal association openly separated from him, and a bitter feud between "young" and "old" Ireland ensued. In this quarrel, O'Connell steadfastly maintained his favorite precept of "moral force," and was supported by the great body of the Catholic bishops and clergy; but his health gave way in the struggle. He was ordered to try a milder climate: and on his journey to Rome in the spring of 1847, he was suddenly seized with paralysis, and died at Genoa on May 15 of that year. His eminence as a public speaker, and especially as a master of popular eloquence, is universally admitted. Into the controversies as to his public and political character, it is not our place to enter here. His speeches unfortunately were for the most part extempore, and exist but in the reports (uncorrected by himself) taken at the time. He published but a single volume, *A Memoir of Ireland, Native and Saxon*, and a few pamphlets, the most important of which, as illustrating his personal history and character, is *A Letter to the Earl of Shrewsbury.*—See *Life and Times of Daniel O'Connell*, by his son, John O'Connell; also *Recollections of Daniel O'Connell*, by John O'Neill Daniel; Fagan's *Life of Daniel O'Oonnell;* and *The Liberator*, by L. F. Cusack (1872).

O'CONNELL, EUGENE, D.D. See page 894.

O'CONNOR, ARTHUR, 1763–1852; b. Ireland; called to the bar in 1788. Soon afterwards he entered the Irish parliament, where he advocated Roman Catholic emancipation; his course in this regard caused his uncle, lord Longueville, to disinherit him. Becoming one of the five directors of the "united Irishmen," he was tried for high treason, but acquitted. He then left Ireland for France, where he rose to be lieut.gen., and afterwards gen. of division. He wrote *Letters to the Earl of Carlisle*, 1795; *Letters to Earl Camden*, 1798; *The Present State of Great Britian*, 1804; and other works. He married a daughter of Condorset.

O'CONNOR, FEARGUS EDWARD, 1796–1855; b. in co. Meath, Ireland. In 1832 he was elected member of parliament for Cork, and when re-elected, in 1835, lost his seat on account of his disqualifications. He then became a prominent member of the so-called "chartist" party, and carried on the agitation for the extension of the ballot and other privileges to the lower classes. He was again returned to parliament in 1857 from Nottingham. Disheartened by the small success of his efforts he became insane in 1852.

O'CONNOR, JAMES, D.D. See page 894.

O'CONNOR, RODERICK, (RORY), king of Ireland, 1116–98; b. Connaught; son of Turlogh O'Connor, king of Connaught, whom he succeeded in 1156. After a protracted contest with the O'Briens and O'Neals, he took the title of king of Ireland in 1166. He drove Dermot, king of Leinster, out of his kingdom in 1168, but afterwards reseated him on the throne. He worsted Strongbow and the English in a number of battles, but finally entered into a convention with them. In 1175 he had an interview with Henry II. of England, to whom he did homage, and whom he recognized as lord paramount of Ireland. Roderick kept the crown of Connaught till 1186, when, on account of a revolt of his sons, he entered a monastery, where he passed the rest of his life.

O'CONNOR, WILLIAM DOUGLAS, b. Mass., 1833; a journalist who commenced life as an art student in Boston, in 1853 became one of the editors of the *Commonwealth*, a newspaper published in that city. In 1854 he entered into an editorial connection with the *Saturday Evening Post* of Philadelphia, retaining it six years. He was twelve years corresponding clerk of the light-house board at Washington, and in 1873 became chief clerk, in 1884 librarian of the treasury dept., of which the light-house board is a branch. He is now asst. gen. supt. in the office of the Life saving service. He has contributed a number of essays, stories, and poems to the popular magazines; and in 1860, published *Harrington*, a romance; and in 1866, *The Good Grey Poet*, a pamphlet in favor of Walt

Whitman; and in 1867, *The Ghost.* His story of *The Carpenter*, which appeared in one of the periodicals, attracted much attention and critical comment.

OCONOMOWOC, a t. in Waukesha co., Wisconsin, on Oconomowoc creek, and the Chicago, Milwaukee, and St. Paul railroad; pop. '80, 2,174. There are a number of lakes in the vicinity, and it is a popular summer resort. It has three newspapers, a bank, a seminary for girls, and seven churches.

O'CONOR, CHARLES, LL.D.; b. New York city, 1804. His father came to this country from Ireland, and was a man of good family and liberal education. As he lost a considerable fortune shortly after his arrival here, he was unable to give his son a university education. At the age of 20, O'Conor was admitted to the bar of New York state. By his industry and high intellectual ability he soon gained high rank in the profession. Among the cases in which he has been concerned are many of national interest, such as that of the slave Jack, 1835. Other of his best known cases are the Lispenard, Parish, and Jumel will litigations, and the Forrest divorce suit. In politics, Mr. O'Conor was a democrat, but he rarely accepted office. He was district attorney under president Pierce for a little over a year, was also member of several state conventions, and in 1872 was nominated for the presidency by the "labor reform" party, and by a convention of democrats dissatisfied by the nomination of Horace Greeley. He received in all but 29,489 votes, which were merely complimentary, as he had declined both nominations. He had always taken interest in the city government and local reform, and was one of the prosecuting counsel in the "ring" cases, as they were called, brought against the municipal officers of New York in 1873. He d. 1884.

OCONTO, a co. in n.e. Wisconsin, bounded on the n.e. by Michigan and the Menomonee river, and on the s.e. by Green bay; watered by the Peshtigo and Oconto rivers, on the Chicago and Northern railroad; 5,000 sq.m.; pop. '80, 9,848—6,218 of American birth. The surface is heavily wooded with pine. The chief staples are wheat, potatoes, oats, and hay. Large quantities of lumber are exported. Co. seat, Oconto.

OCONTO, Wis. See page 894.

OCOSIN'GO, a t. in the state of Chiapao, Mexico; pop. 4,000. It is noted for the aboriginal monuments near it, of which an account has been given by Stephens in his *Incidents of Travel* in Central America.

OCTAGON, a plane closed figure of 8 sides. When the sides are equal, and also the angles, the figure is called a "regular octagon;" in this case, each angle is 135°, or equal to three half right angles. If the alternate corners of a regular octagon be joined, a square is constructed; and as the angle contained between the sides of the square and of the octagon is one-fourth of a right angle, the octagon may easily be constructed from the square as a basis.

OCTAHE'DRON (Gr. *okto,* eight, *hedra,* base) is a solid figure bounded by 8 triangles, and having 12 edges and 6 angles. A *regular* octahedron has its 8 triangular faces all equilateral, and may, for convenience, be defined as a figure composed of two equal and similar square pyramids with equilateral triangles for their sides placed base to base. This solid is symmetrical round any angle, and is one of Plato's 5 regular solids. The octahedron appears in nature as one of the forms of crystals of sulphur.

OCTAVE (Lat. *octavus,* eighth), the interval between any musical note and its most perfect concord, which is double its pitch, and occupies the position of the eighth note from it on the diatonic scale. The name octave is often given to the eighth note itself as well as to the interval. There is between a note and its octave a far closer relation than between any other two notes; they go together almost as one musical sound. In combination, they are hardly distinguishable from one another, and their harmonics agree invariably, a coincidence which occurs in the case of no other interval.

OCTA'VIA, the sister of the Roman emperor Augustus, and wife of Mark Antony. She was distinguished for her beauty, her noble disposition, and womanly virtues. Her first husband was C. Marcellus, to whom she was married 50 B.C. He died 41 B.C., shortly after which she consented to marry Antony, to make secure the reconciliation between him and her brother. The event was hailed with joy by all classes. In a few years Antony became tired of his gentle and virtuous spouse, and forsook her for Cleopatra. When the Parthian war broke out, Octavia wanted to accompany her husband, and actually went as far as Corcyra, whence Antony sent her home, that she might not interrupt his guilty intercourse with the Egyptian queen. In 35 B.C., Octavia made an effort to rescue him from a degradation that was indifferent even to the honor of the Roman arms, and sailed from Italy with re-enforcements; but a message reached her at Athens ordering her to return home. She proudly obeyed, but, with a magnanimity that reminds us of the Roman character in earlier and better days, she forwarded the supports to her husband. Her brother, Octavian, was indignant at the treatment she received, and would have had her quit her husband's house, and come and live with him: but she refused. In 32 B.C. war, long inevitable, broke out between Antony and Octavia; and the former crowned his insults by sending Octavia a bill of divorcement. But no injury was too great to be forgiven by this "patient Grizel" of the ancient world; and after her husband's death, she brought up with maternal care not only her own children, but also Cleopatra's bastards. Her death took place 11 B.C.

OCTOBER (Lat. *octo,* eight) was the eighth month of the so-called "year of Romulus," but became the tenth when (according to tradition) Numa changed the commencement of the year to the first of January, though it retained its original name. It has since maintained its position as the tenth month of the year, and has 31 days. October preserved its ancient name notwithstanding the attempts made by the Roman senate, and the emperors Commodus and Domitian, who substituted for a time the terms Faustinus, Invictus, Domitianus. Many Roman and Greek festivals fell to be celebrated in this month, the most remarkable of which was the sacrifice at Rome of a horse (which was called *October*) to the god Mars. The other festivals were chiefly bacchanalian. Among the Saxons it was styled *Wyn moneth* or the wine month.

OCTO'PODA (Gr. eight-footed), a section of dibranchiate cephalopods (see CEPHALOPODA), having the body in general very short, the head very distinct; eight arms, not very unequal, furnished with simple suckers; with or without a shelly covering. To this section belong argonauts, poulpes, etc.

OCTO'PUS. See POULPE.

OCTOSTYLE, the name given in classic architecture to a portico composed of eight columns in front.

OCTROI (Lat. *auctoritas,* authority), a term which originally meant an ordinance authorized by the sovereign, and thence came to be restrictively applied to a toll or tax in kind levied from a very early period in France, and other countries of northern Europe, on articles of food which passed the barrier or entrance of a town. The right to levy this toll was often delegated to subjects, and, in order to increase its amount, a device was resorted to of raising the weight of the pound in which the octroi was taken. The large pound, an ounce heavier than that in ordinary use, was called the *livre d'octroi,* whence the expression *pound troy.* The octroi came eventually to be levied in money, and was abolished in France at the revolution. In 1798 it was re-established, under the pretext that it was required for purposes of charity, and called the *octroi de bienfaisance,* and it has been reorganized in 1816, 1842, and 1852. Of the octroi duty which is at present levied at the gates of the French towns, one-tenth goes to the national treasury, and the rest to local expenses. The octroi officers are entitled to search all carriages and individuals entering the gates of a town. From the octrois of Paris government derived, a few years ago, a revenue of 56 million francs. In 1860 the Belgian government acquired popularity by abolishing the octroi.

The epithet *octroyé* is applied by continental politicians to a constitution granted by a prince, in contradistinction to one which is the result of a paction between the sovereign and the representatives of the people. Any public company possessing an authorized monopoly like that held by the East India company is said to be *octroyé.*

O'CURRY, EUGENE, 1796–1862; b. Ireland; appointed in 1834 an assistant in the ordnance survey of Ireland. In 1841 he began to catalogue and copy the Gaelic MSS. of Trinity college, Dublin, and the Royal Irish academy, and assisted in the preparation of the Irish archæological society's publications. In 1853 he was associated with Dr. O'Donovan in the translation of the ancient Brehon laws. In 1854 he became professor of Irish history and archæology in the new Roman Catholic university in Dublin. He published a translation of the *Battle of the Magh Leana, together with the Courtship of Mornera* (1855), and *Lectures on the Manuscript Materials of Ancient Irish History* (1861).

OD (from the same root as Odin, and supposed to mean all-pervading), the name given by baron Reichenbach (q.v.) to a peculiar physical force which he thought he had discovered. This force, according to him, pervades all nature, and manifests itself as a flickering flame or luminous appearance at poles of magnets, at the poles of crystals, and wherever chemical action is going on. This would account for the luminous figures said to be sometimes seen over recent graves. The odd force has positive and negative poles, like magnetism. The human body is od-positive on the left side, and od-negative on the right. Certain persons, called "sensitives," can see the odic radiation like a luminous vapor in the dark, and can feel it by the touch like a breath. As the meeting of like odic poles causes a disagreeable sensation, while the pairing of unlike poles causes a pleasant sensation, we have thus a sufficient cause for those likings and antipathies hitherto held unaccountable. Some sensitive persons cannot sleep on their left side (in the northern hemisphere), because the north pole of the earth, which is od-negative, affects unpleasantly the od-negative left side. All motion generates od; why, then, may not a stream running underground affect a sensitive water-finder, so that the divining-rod in his or her hand shall move without, it may be, any conscious effort of will? All the phenomena of mesmerism are ascribed to the workings of this od-force. Reichenbach does not pretend to have had the evidence of his own senses for any of those manifestations of his assumed od-force; the whole theory rests on the revelations made to him by "sensitives." It may be added, that few, if any, really scientific men have any belief in the existence of such a force.—Those curious in such matters are referred for the details of the subject to Reichenbach's large work, translated by Dr. Ashburner, *The Dynamics of Magnetism,* or to the account in his *Odisch-Magnetische Briefe* (Stutt. 1852). See also: *Transactions of the Psychical Research Society* (1881).

O'DAL or **UDAL RIGHT** (Celtic *od*, property), a tenure of land which was absolute, and not dependent on a superior, and prevailed throughout northern Europe before the rise of feudalism. It was founded on the tie of blood which connected freeman with freeman, and not on the tie of service. It was the policy of the sovereign authority everywhere to make it advantageous for the freemen to exchange the odal tie for the tie of service—a change which paved the way for the feudal system. The odalers of Orkney were allowed to retain or resume their ancient privileges, on paying a large contribution to the erection of St. Magnus's cathedral at Kirkwall; and the odal tenure prevails to this day to a large extent in the Orkney and Shetland islands, the right to land being completed without writing by undisturbed possession proved by witnesses before an inquest.

ODD-FELLOWS, the name assumed by one of the most extensive self-governed provident associations in the world. The institution was originated in Manchester in 1812, although isolated "lodges" had existed in various parts of the country for some time previously. These latter were generally secret fraternities, humble imitations of Freemasonry—adopting a similar system of initiatory rites, phraseology, and organization—instituted for social and convivial purposes, and only occasionally extending charitable assistance to members. On its institution in Manchester, the main purpose of odd-fellowship was declared by its laws to be, "to render assistance to every brother who may apply through sickness, distress, or otherwise, if he be well attached to the queen and government, and faithful to the order;" and this continues to be the basis of all its operations. It still, however, retains some of the characteristics of freemasonry, in possessing pass-words and peculiar "grips," whereby members can recognize one another. The headquarters of the society are at Manchester, where the grand-master and board of directors meet quarterly to hear appeals, and transact the general business of the order. In Jan., 1852, the total number of members was 224,441; in Jan., 1882, the number was 547,909. The lodges number 4,153, spread over 452 districts; the annual income being about £780,000, with considerably less expenditure. Should any lodge fail to meet its legitimate obligations, the district becomes liable; failing the district, the responsibility falls upon the entire unity. The order is widely spread over the whole of England and Scotland. It exists independently in America (where there are near 420,000 members of the separated association), Australia, New Zealand, and the West Indies; but there are "lodges" in Philadelphia, New York, in all the British colonies, and one in Constantinople (originated in 1862), which are affiliated to and in connection with the Manchester board. These widespread ramifications of this society enable emigrant members to be at once received into fellowship in those countries. In the American states, odd-fellowship is said to exercise considerable political influence. A quarterly periodical, called the *Odd-fellows' Magazine*, devoted to its interests, is published in Manchester. In an early number of this publication, an odd-fellow is described as "like a fox for cunning, a dove for tameness, a lamb for innocence, a lion for boldness, a bee for industry, and a sheep for usefulness."

ODD-FELLOWS, INDEPENDENT ORDER OF. The order was introduced into the United States in 1806. Some persons who had been members of English lodges established a lodge at Baltimore in 1819; and this lodge soon received a charter from the Manchester unity. The lodges already established in New York, Philadelphia, and Boston accepted charters from the Maryland grand lodge. The American lodges have long ceased to hold friendly relations with the Manchester unity. The U. S. grand lodge has established grand lodges in all the states and in most of the territories. About 20 periodicals, devoted to the order, are published in this country. American odd-fellowship seeks "to visit the sick, relieve the distressed, bury the dead, and educate the orphan." There were, in 1884, 522,318 members of the organization in the United States, and the annual disbursements for relief of families, burials, education, etc., were over $2,015,832; grand lodges, 54; subordinate, 8,002. To become a member of a lodge one must be a white male, at least 21 years of age, and must believe in a supreme being.

ODE (Gr. a song) originally meant any lyrical piece adapted to be sung. In the modern use of the word, odes are distinguished from songs by not being necessarily in a form to be sung, and by embodying loftier conceptions and more intense and passionate emotions, The language of the ode is therefore abrupt, concise, and energetic; and the highest art of the poet is called into requisition in adapting the meters and cadences to the varying thoughts and emotions. Hence the changes of meter and versification that occur in many odes. The rapt state of inspiration that gives birth to the ode, leads the poet to conceive all nature as animated and conscious, and instead of speaking *about* persons and objects, to address them as present. See *Gosse's English Odes* (1881).

Among the highest examples of the ode are the *Song of Moses* and several of the psalms. Dryden's *Alexander's Feast* is reckoned one of the first odes in the English language. We may mention, as additional specimens, Gray's *Bard*, Collin's *Ode to the Passions*, Burns's *Scots wha ha'e*, Coleridge's *Ode to the Departing Year* and *Dejection*, Shelley's *Ode to the Skylark*, and Wordsworth's *Ode on the Recollections of Immortality in Childhood.*

ODENHEIMER, WILLIAM HENRY, D.D., 1817-80; b. Philadelphia; educated at the university of Pennsylvania. He took orders in the Protestant Episcopal church, became

rector of St. Peter's church, Philadelphia, in 1840, and was elected bishop of New Jersey in 1859. He published *The Origin of the Prayer-Book* (1841), an essay on *Canon Law*, (1847), *Jerusalem and Vicinity* (1855),and other works.

O'DENKIRCHEN, a t. of Rhenish Prussia, 15 m. w.s.w. from Düsseldorf, near the right bank of the Niers. It has manufactures of velvets, paper, leather, etc., and like many of the other manufacturing towns in the same district, has recently much increased in size and population. Pop. '75, 7,848.

O'DENSEE, anciently known as Odin's-Ey or Odin's Oe (i.e., Odin's island), the chief town of the Danish island of Fünen, and the oldest city of the kingdom, is situated in the amt or district of the same name, in 55° 25′ n. lat., and 10° 20′ e. long. Pop. '70, 16,970. Odensee, which is the seat of the governor of the island and the see of a bishop, has a gymnasium, several literary societies, and is an active, thriving provincial town. A bishopric was founded here in 988, prior to which time Odensee bore the reputation of being the first city established by Odin and his followers. The cathedral, founded in 1086 by St. Knud, whose remains, like those of several of the early Danish kings, were deposited here, is a fine specimen of the early simple Gothic style. The lay convent or college for ladies contains an extensive library, furnished with copies of all printed Danish works. At Odensee a diet was held in 1527, in which the reformed or Lutheran doctrines were declared to be the established creed of Denmark, and equality of rights was granted to Protestants; while another diet held there in 1539 promulgated the laws regulating the affairs of the reformed church.

O'DENWALD. See HESSE-DARMSTADT.

ODE'ON, a musical theater among the ancient Greeks, built on the same plan as the theater, but smaller, and covered with a roof. The first was at Sparta, about the middle of the 7th c. B.C. It was called the Skias, and was designed by Theodorus, an architect of Samos. Athens had an old one near the Ilissus, but Pericles erected a better one. It stood near the base of the acropolis, on the s.e. side, and its form was said to be imitated from that of Xerxes' tent. It was burned at the siege of Athens by Sulla, and soon after re-erected by Ariobarzanes, king of Cappadocia. There were two other odeons in Athens,one of which, built by Herodes Atticus, had a capacity of 8,000. Each principal Greek city had its odeon; and it was introduced into Rome by Domitian.

O'DER (Lat. *Viadrus*, Slavon. *Vjodr*), one of the principal rivers of Germany, rises in the Leselberg on the table-land of Moravia, more than 1000 ft. above the level of the sea, and enters Prussian Silesia at Odersberg, after a course of some 90 miles. After traversing Brandenburg in a n.w. direction, it crosses Pomerania, and empties itself into the Stettiner Haff, from whence it passes into the Baltic by the triple arms of the Dievenow, Peene, and Swine, which inclose the islands of Wollin and Usedom. The Oder has a course of more than 500 m., and a river-basin of 50,000 sq.miles. The rapid flow of this river, induced by its very considerable fall, is accelerated by the affluence of several important mountain-streams, and thus contributes, together with the silting at the embouchures of these streams, to render the navigation difficult; great expense and labor being, moreover, necessary to keep the embankments in order, and prevent the overflowing of the river. The Oder has numerous secondary streams, the most important of which are the Oppa, Neisse, Ohlau, Klodnitz, Bartsch, Warte, and the Ihna; and is connected with the Havel and thence with the Elbe by the Finow canal, and with the Spree by the Friedrich-Wilhelms canal. The chief trading port of the Oder is Swinemunde, which constitutes an important center for the transfer of colonial and other foreign goods to northern Germany and Poland. At Ratibor, 17 m. below Oderberg, the river becomes navigable, and is upwards of 100 ft. in breadth; at Oppeln, in Prussian Silesia, it has a breadth of 238 feet. As a boundary river, it is of considerable importance in a military point of view, and is well defended by the fortresses of Kosel, Grossglogau, Küstrin, and Stettin.

ODERZO, a t. in the Italian province of Treviso, 14 m. n.e. of the town of Treviso; pop. about 6,500. In ancient times the place was called *Opitergium*, and it is stated that in the wars of Cæsar and Pompey, 1000 young men from this town slew themselves in preference to remaining the prisoners of Pompey. It was formerly much larger than at present, but still has some business activity. Its chief interest is from its numerous palaces, pictures, and antiquities. The villa *Colfrancui* contains many inscriptions, bas-reliefs, and bronze, iron, ivory, and gold objects of art, found near by.

ODESSA, an important seaport and commercial city of s. Russia, in the government of Kherson, stands on an acclivity sloping to the shore, on the n.w. coast of the Black sea, 32 m. n.e. of the mouth of the Dniester. Lat. 46° 29′ n., long. 30° 44′ east. The harbor is formed by two large moles defended by strong works, and is capable of containing 200 vessels. The bay is deep enough even close in shore to admit the approach of the largest men-of-war, and is frozen only in the severest winters, and then only for a short time. The promenade along the face of the cliff, descending to the shore by a broad stone stair of 204 steps, is the favorite walk of the inhabitants. Here also stands the monument of the duc de Richelieu, to whom in great part the town is indebted for its prosperity. In the pedestal of the monument is preserved the ball by which he was shot during the bombardment of the town by the allied fleet in 1854. The university of

Odessa, founded in 1865, had, in 1877, 43 professors and 252 students; and the library possessed over 150,000 volumes. The city contains many fine edifices, as the cathedral of St. Nicholas, the admiralty, the custom-house, etc. Owing to the intensity of the heat in summer (rising occasionally to 120°), and the dryness of the soil, vegetation in the vicinity of Odessa is very poor. In the neighborhood are quarries of soft stone, which is used for building purposes in Odessa and in the surrounding towns. One of the great deficiencies of Odessa used to be its want of good water; but works for securing an ample supply from the Dniester were completed in 1873. Gas was first used in Odessa in 1861; and the theater, the hotels, and all the larger houses now use the handiest of the artificial lights. A railway, opened in 1872, has added enormously to the commercial success and importance of Odessa, as it connects it, and of course Kherson, with the governments n. and e. of it in Russia. The estimated value of the various quantities of grain, wool, hides, tallow, and other articles of export for the year 1871 was £7,110,000, of which amount, the value of goods shipped in British vessels was £2,372,000. In 1876 the total exports were valued at about £7,790,000, and the imports at £7,350,000. The rapid strides Odessa has made in commerce within the last few years will be seen when these latter sums are compared with the corresponding ones of 1858 and 1869; the former year showing the sum of £670,000, and the latter exhibiting a fall down to £465,000. The pop. of Odessa in 1877 was 193,513.

In ancient times, Odessa (Gr. *Odessus*) was inhabited by a Greek colony, and later by Tartar tribes. In the beginning of the 15th c., the Turks constructed a fortress here, which was taken by the Russians in 1789. In 1793 a Russian fortress was built here, and became the nucleus of a town and port, which two years after received the name of Odessa. The duc de Richelieu, a French emigrant in the Russian service, was appointed governor here in 1803, and during the 11 years of his wise administration the town prospered rapidly. Since 1823 the city has formed part of the general governorship of s. Russia; is the seat of its administration, and is the residence of the gov.gen. and of an archbishop. The advantageous commercial position of the city, and the privileges granted to it by government, but chiefly the privileges of a free port between 1817 and 1858 (in place of which it now receives an annual subsidy) have developed this city from a mere Turkish fortress into the chief commercial town of the Russian empire after St. Petersburg and Riga. On the outbreak of the Crimean war, April 1854, the British steamer *Furious* went to Odessa for the purpose of bringing away the British consul. While under a flag of truce, she was fired upon by the batteries of the city. On the failure of a written message from the admirals in command of the fleet to obtain explanations, 12 war-steamers invested Odessa, April 22, and in a few hours destroyed the fortifications, and took a number of Russian vessels.

ODGER, George. See page 894.

ODIC FORCE. See Od, *ante.*

ODEYPOOR', Oodypore, or Udaipur, the name of several territories in India.—1. The principal is a Rajpoot state, also called Meywar; area about 11,600 sq.m., and pop. '71, 1,160,000.—2. A tributary state in Chota Nagpore, with an area of 1051 sq.m.; pop. 27,708.—3. Chota Odeypoor is a tributary state in Gujerat; area 650 m.; pop. 62,913.

O'DIN, the chief god of northern mythology. According to the sagas, Odin and his brothers, Vile and Ve, the sons of *Boer*, or the first-born, slew Ymer or Chaos, and from his body created the world, converting his flesh into dry land; his blood, which at first occasioned a flood, into the sea; his bones into mountains; his skull into the vault of heaven; and his brows into the spot known as *Midgaard*, the middle part of the earth, intended for the habitation of the sons of men. Odin, as the highest of the gods, the *Alfader*, rules heaven and earth, and is omniscient. As ruler of heaven, his seat is Valaskjalf, from whence his two black ravens, Huginn (Thought) and Muninn (Memory), fly daily forth to gather tidings of all that is being done throughout the world. As god of war, he holds his court in Valhalla, whither come all brave warriors after death to revel in the tumultuous joys in which they took most pleasure while on earth. His greatest treasures are his eight-footed steed Sleipner, his spear Gungner, and his ring Draupner. As the concentration and source of all greatness, excellence, and activity, Odin bears numerous different names. By drinking from Mimir's fountain he became the wisest of gods and men, but he purchased the distinction at the cost of one eye. He is the greatest of sorcerers, and imparts a knowledge of his wondrous arts to his favorites. Frigga is his queen, and the mother of Baldur, the Scandinavian Apollo; but he has other wives and favorites, and a numerous progeny of sons and daughters. Although the worship of Odin extended over all the Scandinavian lands, it found its most zealous followers in Denmark, where he still rides abroad as the wild huntsman, rushing over land and water in the storm-beaten skies of winter.

The historical interpretation of this myth, as given by Snorre Sturleson, the compiler of the *Heimskringla*, or chronicles of the kings of Norway prior to the introduction of Christianity, and followed in recent times by the historian Suhm, is that Odin was a chief of the Œsir, a Scythian tribe, who, fleeing before the ruthless aggressions of the Romans, passed through Germany to Scandinavia, where, by their noble appearance, superior prowess, and higher intelligence, they easily vanquished the inferior races of those lands, and persuaded them that they were of godlike origin. According to one tradition, Odin conquered the country of the Saxons on his way; and leaving one of his

sons to rule there, and introduce a new religion, in which he, as the chief god Wuotan, received divine honors, advanced on his victorious course, and making himself master of Denmark, placed another son, Skjold, to reign over the land, from whom descended the royal dynasty of the Skjoldingar. He next entered Sweden, where the king, Gylfi, accepted his new religion, and with the whole nation worshipped him as a divinity, and received his son Yugni as their supreme lord and high-priest, from whom descended the royal race of the Yuglingars, who long reigned in Sweden. In like manner he founded, through his son Sœming, a new dynasty in Norway; and besides these, many sovereign families of northern Germany, including our own Saxon princes, traced their descent to Odin. As it has been found impossible to refer to one individual all the mythical and historical elements which group themselves around the name of Odin., Wodin, or Wuotan, it has been suggested by Suhm and other historians, that there may have been two or three ancient northern heroes of the name; but notwithstanding the conjectures which have been advanced since the very dawn of the historical period in the n. in regard to the origin and native country of the assumed Odin, or even the time at which he lived, all that relates to him is shrouded in complete obscurity. It is much more probable, however, that the myth of Odin originated in nature-worship. See SCANDINAVIAN MYTHOLOGY.

ODLING, WILLIAM, b. England, 1829; studied medicine in Guy's hospital, and at the university of London. In 1863 he became professor of chemistry at St. Bartholomew's hospital. In 1861 he published a *Manual of Chemistry*, and in 1866 *Lectures on Animal Chemistry*. In 1868 he succeeded Faraday as Fullerian professor at the royal institution, and in 1872 became professor of chemistry at Oxford.

ODO, SAINT, 879–943, second abbot of Clugny, son of Abbon, a powerful lord at the court of William the strong, duke of Aquitaine, solemnly consecrated by his father to the church even before his birth. His education, commenced in the convent of St. Martin of Tours under the guidance of saint Odalric, was completed at Paris. He returned to St. Martin, but, thinking that its rule was not strict enough, left it and entered the Cistercian convent at Baume, in Burgundy. After the death of Bernon, Odo was chosen to succeed him as abbot of Clugny and of Bourgdeols. Under his energetic administration the order rapidly increased in reputation and wealth. The fame of the school of Clugny was diffused far and wide. The aid of Odo was sought in reforming converts in various quarters. The popes sent for him to settle disputes between princes and kings, intrusted him with the most important diplomatic negotiations. On his return from a journey to Rome he died in the convent of St. Julian at Tours. He was profoundly conscious of the corruption in the church among the clergy, monks, and laity; and while full of zeal for the renovation of the Christian life, did not regard asceticism as Christian perfection, though he sought to correct the secularized life of the clergy by a severe monastic discipline. In the midst of prevailing corruption his pious zeal and pure life gave him great influence and authority. He was a diligent writer, and composed many anthems and hymns.

ODOA'CER (also ODOVACER, ODOBAGAR, ODOVACHAR, OTACHAR, etc., and, according to St. Martin, the same as OTTOCHAR, a name frequent in Germany during the middle ages), the ruler of Italy from the year 476 to 493, was the son of Edecon, a secretary of Attila, and one of his ambassadors to the court of Constantinople. This Edecon was also capt. of the Scyrri, who formed the bodyguard of the king of the Huns. After the death of Attila he remained faithful to the family of his master, but perished about 463 in an unequal struggle with the Ostrogoths. He left two sons, Onulf and Odoacer, the former of whom went to seek his fortune in the east; while Odoacer, after leading for some time the life of a bandit chief among the Noric Alps, determined to proceed to Italy, whither barbarian adventurers were flocking from all Europe. According to a monkish legend, a pious hermit, St. Severinus, whom he went to visit before his departure, prophesied his future greatness. Odoacer entered the military service of the western Roman empire, and rapidly rose to eminence. He took part in the revolution by which Orestes (475) drove the emperor Julius Nepos from the throne, and conferred on his son Romulus the title of Augustus, which the people scoffingly changed into Augustulus. He soon perceived the weakness of the new ruler, and resolved to profit by it. He had little difficulty in persuading the barbarian soldiery, who had effected the revolution, that Italy belonged to them, and in their name demanded of Orestes the third part of the land as the reward of their help. This Orestes refused; and Odoacer, at the head of his Herulians, Rugians, Turcilingians, and Scyrii, marched against Pavia, which Orestes had garrisoned, stormed the city, and put his opponent to death (476). Romulus abdicated, and withdrew into obscurity. What became of him is not known. Thus perished the Roman empire. Odoacer showed himself to be a wise, moderate, and politic ruler, quite unlike our general notion of a barbarian. In order not to offend the Byzantine emperor Zeno, he took the title of king only, and caused the senate to despatch to Constantinople a flattering letter, in which it declared one emperor to be enough for both east and west; renounced its right of appointing the emperors, expressed its confidence in the civil and military talents of Odoacer, and begged Zeno to confer upon him the administration of Italy. After some hesitation the Byzantine emperor yielded to the entreaties of the senate, and Odoacer received the title of *Patricius*. He

fixed his residence at Ravenna. According to his promise he divided among his companions the third part of the land of Italy—a measure far less unjust than at first sight may seem, for the peninsula was then almost depopulated, and many domains were lying waste and ownerless. This barbarian ruler did everything in his power to lift Italy out of the deplorable condition into which she had sunk, and to breathe fresh life into her municipal institutions—those venerable relics of nobler days! He even re-established the consulate, which was held by eleven of the most illustrious senators in succession, maintained peace throughout the peninsula, overawed the Gauls and Germans, and reconquered Dalmatia and Noricum. In religion, though an Arian himself, he acted with a kingly impartiality that more orthodox monarchs have rarely exhibited. Gibbon remarks, with his usual pointed sarcasm, that the *silence* of the Catholics attests the toleration which they enjoyed. The valor, wisdom, and success of Odoacer appear to have excited the jealousy and alarm of Zeno, who encouraged Theodoric, king of the Ostrogoths, a still greater warrior and sovereign than Odoacer himself, to undertake an expedition against Italy. The first battle was fought on the banks of the Isontius (mod. *Isonzo*), Aug. 28, 489. Odoacer was beaten, and retreated. During his retreat he hazarded another battle at Verona, and was again beaten. He now hastened to Rome to rouse the inhabitants, but the gates of the city were closed against him. Returning northwards to his capital, Ravenna, he reassembled the wrecks of his army, and in 490 once more marched against the Ostrogoths, whose advance guard he defeated and pursued to the walls of Pavia. Another great battle now took place on the banks of the Adda, when Odoacer was vanquished for the third time. He now shut himself up in Ravenna, where Theodoric besieged him for three years. Odoacer then capitulated, on condition that the kingdom of Italy should be shared between him and Theodoric. This agreement was solemnly sworn to by both parties, Feb. 27, 493; but on March 5 Odoacer was assassinated at a feast, either by Theodoric himself or by his command.

ODOM'ETER (Gr. *odos*, a road, *mĕtrŏn*, a measure), also called *perambulator*, or *surveying-wheel*, is an instrument attached to a carriage or other vehicle, for the purpose of registering the distance it has traveled. Such machines have been in use from an early period, and one is described by Vitruvius in that part of his work, *De Architectura*, which is devoted to machines. The instrument, as commonly employed, consists of a train of wheel-work, which communicates motion from the axle of the carriage wheel to an index which moves round the circumference of a dial fixed in one side of the carriage over the axle. The wheel-work is arranged so as to produce a great diminution of the velocity impressed by the axle of the vehicle, and the dial is so graduated that the index can show the number of miles, furlongs, yards, etc., traversed. The instrument is also constructed to work independently, being in this case provided with wheels and an axle of its own; when this is done the wheel is made of such a size that its circumference is an aliquot part of a mile, an arrangement which greatly simplifies the calculation of the distance traversed. The complete odometer can then be drawn along by a man on foot, or attached behind a carriage. See PEDOMETER.

O'DONNELL, LEOPOLD, Duke of Tetuan, Marshal of Spain, b. in 1809, was descended from an ancient Irish family. He entered the Spanish army when young, and bravely espoused the cause of the infant queen Isabella against her uncle, Don Carlos. When the Carlists were overthrown, he was created count of Lucena, made gen. of brigade, and chief of the staff to Espartero. He took the side of the queen-mother in 1840, emigrated with her to France at the time when her cause seemed desperate, and took up his residence at Orleans, where he planned many of the political risings and disturbances which took place under the rule of Espartero. He headed in person a revolt of the Navarrese against the minister, but on its failure returned to France. In 1843 his intrigues against Espartero (q.v.) were successful, and he was rewarded by the governor-generalship of Cuba, where he amassed a large fortune by favoring the iniquitous trade in slaves. When he returned to Spain (1845) he intrigued against Bravo Murillo and Narvaez; and when the latter was succeeded by Sartorius, O'Donnell, proscribed by the government, headed a military insurrection. Defeated and driven into Andalusia in 1854, he issued a liberal manifesto. The profligacy of the court and the despotism of the government favored the appeal; and when Espartero gave in his adhesion, the Spaniards rose *en masse* and replaced the ex-regent at the helm. Espartero reversed the confiscation against O'Donnell, and made him a marshal and minister of war. O'Donnell again plotted against his old benefactor, and in July, 1856, supplanted him by a *coup d'état*. Blood was shed in the streets of Madrid, but O'Donnell remained president of the council. He was in three months' time succeeded by Narvaez; but in 1858 he returned to power again, and in 1859, while still holding the position of prime minister, he assumed the command of the army sent to Morocco. The campaign continued for many months, without leading either to reverses or glory. The Moors displayed an entire absence of military qualities; and O'Donnell, though successful in obscure skirmishes, occupied three months in the march from Ceuta to Tetuan. A battle took place, Feb. 4, 1860; O'Donnell gained a complete victory, took the Moorish camp, and the city of Tetuan surrendered to the Spaniards. The emperor of Morocco submitted to a loss of territory, and O'Donnell was raised to the first rank of the Spanish nobles as duke of Tetuan. He remained prime minister till 1866, when his cabinet was

upset by Narvaez. He then received leave of absence—that is to say, was exiled and spent the most of his time in Paris. He died at Biarritz in 1867. The O'Donnell ministry improved the finances, army, and administration of Spain.

ODONTASPID'IDÆ, a family of sharks nearly related to the mackerel shark, but having shape more like that of ordinary sharks. Head depressed; eyes have no nictitant membrane; nostrils simple and far from the mouth, which is wide and inferior; teeth nail like, with basal cusps in both jaws. Dorsal fins two, the first in front of the ventrals. Tail has no pits at the root, and no lateral keels. The family is a small one, one species, *O. ferox*, inhabiting the Mediterranean; and there is an American Atlantic species, known as *sand shark*, which is also said to be found at the cape of Good Hope, and at Tasmania and Australia.

ODONTOL'OGY. See TEETH, *ante*.

ODONTOR'NITHES, a sub-class of birds whose fossils have been found by Marsh in the cretaceous formation of Kansas. They include two orders, odontolcæ, and odontormæ. The order odontolcæ was founded by Marsh for the reception of the extraordinary *hesperornis regalis*. The fossil of this gigantic bird indicates that in many points of structure it resembled the loons of the present day. It measured between 5 and 6 ft. from the bill to the toes, and it stood nearly as high. Its jaws were furnished with numererous conical, recurved teeth, sunk deep in a continuous groove. The front of the under jaw was not furnished with teeth, and was probably encased in a horny beak. The breast-bone had no central ridge or keel, and the wings were too small for a bird of flight. The tail consisted of about 12 vertebræ, of which the last three or four were amalgamated to form a flat, terminal mass. The tail was probably capable of a considerable up and down movement, enabling it to act as a paddle. The cervical and dorsal vertebræ were of the ordinary bird type. The legs were powerful and the feet adapted for rapid paddling. It was undoubtedly a swimming and diving bird, larger than any of the present day, and probably lived upon fishes. *Lestornis crassipes*, also of the cretaceous, is nearly related to *hesperornis;* and *enaliornis* of the cretaceous of Great Britain is probably allied to the same genus, but the formation of its jaws is unknown. The next order, odontolcæ, was founded by Marsh for the reception of two remarkable birds which he has named *ichthyornis dispar* and *apatornis celer*. *Ichthyornis dispar* may be taken as the type of the order. Its teeth were contained in distinct sockets instead of grooves as in *hesperornis*. They were small, compressed, and pointed, and all of them which have been preserved are of similiar form. The lower jaw contained about twenty on each side, all more or less inclined backward. Those in the upper jaw resembled those in the lower. The skull was of moderate size, and the eyes placed well forward. The jaws were long and slender, and apparently not encased in a horny sheath. The articular faces of the vertebræ were biconcave, as in fishes. The wings were large in proportion to the legs, and the humerus had an extended radial crest. The metacarpal bones were united as in ordinary birds. Whether the tail was elongated cannot at present be determined, but the last vertebra of the sacrum was very large. The fossil found by prof. Marsh was that of an adult, and about the size of a pigeon. The species was carnivorous, and probably aquatic. *Apatornis* resembled *ichthyornis*, but was rather more slender.

ŒCOLAMPADIUS, JOANNES—a name Latinized, according to the fashion of the age, from the German JOHANN HAUSSCHIEN—one of the most eminent of the coadjutors of Zwingli in the Swiss Reformation, b. in 1482 at Weinsberg, in Swabia. His father destined him for the profession of the law, and he studied for it in Heidelberg and Bologna; but yielding to his own strong inclination, he relinquished this study for that of theology, which he prosecuted at Heidelberg. He then became tutor to the sons of the elector Palatine, and subsequently preacher in Weinsberg. This office he resigned in order to study the Greek language under Reuchlin at Stuttgart. He also learned Hebrew from a Spanish physician, Matthew Adrian. Being appointed preacher at Basel, he formed the acquaintance of Erasmus, who highly appreciated his classical attainments, and employed his assistance in his edition of the New Testament. In 1516, Œcolampadius left Basel for Augsburg, where also he filled the office of preacher, and where he entered into a convent. But Luther's publications exercised so great an influence on him that he left the convent, and became chaplain to Franz von Sickingen, after whose death he returned to Basel in 1522, and in the capacity of preacher and professor of theology, commenced his career as a reformer. He held disputations with supporters of the church of Rome, in Baden in 1526, and in Bern in 1528. In the controversy concerning the Lord's supper, he gradually adopted more and more the views of Zwingli, and at last maintained them in 1525, in a treatise, to which the Swabian ministers replied in the *Syngramma Suevicum*. In 1529 he disputed with Luther in the conference at Marburg. He died at Basel, Nov. 23, 1531, not long after the death of his friend Zwingli. He was remarkable for his gentleness of character. His treatise *De Ritu Paschali*, and his *Epistola Canonicorum Indoctorum ad Eccium*, are the most noted of his works.—See Herzog, *Das Leben des Joh. Œcolampadius* (1843); and Hagenbach's *Œcolampadius* (1859).

ŒCUMEN'ICAL (Gr. *oikoumenike*, "of, or belonging to, the *oikoumene*," "the world"). the name given to councils of the entire church, and synonymous with the more ordi

nary name "general." See COUNCIL. The conditions necessary to constitute an œcumenical council are a subject of much controversy. As the subject is of less importance in Protestant divinity, it will be enough to explain here that a council is said by Roman Catholic divines to be œcumenical in three different ways: viz., in convocation, in celebration, and in acceptation. For the first, the summons of the pope, direct or indirect, is held to be necessary; this summons must be addressed to all the bishops of the entire church. To the second, it is necessary that bishops from all parts of the church should be present, and in sufficient numbers to constitute a really representative assembly; they must be presided over by the pope, or a delegate or delegates of the pope; and they must enjoy liberty of discussion and of speech. For the third, the decrees of the council must be accepted by the pope, and by the body of the bishops throughout the church, at least tacitly. The last of these conditions is absolutely required to entitle the decrees of a council to the character of œcumenical; and even the decrees of provincial or national councils so accepted, may acquire all the weight of infallible decisions, in the eyes of Roman Catholics.

ŒDE'MA (Gr. *a swelling*) is the term applied in medicine to the swelling occasioned by the effusion or infiltration of serum into cellular or areolar structures. The subcutaneous cellular tissue is the most common, but is not the only seat of this affection. It is occasionally observed in the submucous and subserous cellular tissue, and in the cellular tissue of the parenchymatous viscera; and in some of these cases, it gives rise to symptoms which admit of easy recognition during life. Thus œdema of the glottis (see LARYNX) and œdema of the lungs constitute well-marked and serious forms of disease; while œdema of the brain, though not easily recognized during life, is not uncommonly met with in the *post-mortem* examination of insane patients.

Œdema may be either passive or active, the former being by far the most common. *Passive œdema* arises from impeded venous circulation (as from obstruction or obliteration of one or more veins; from varicose veins; from standing continuously for long periods, till the force of the circulation is partly overcome by the physical action of gravitation; from deficiency in the action of the adjacent muscles, which in health materially aids the venous circulation, etc.); from too weak action of the heart (as in dilatation or certain forms of valvular disease of that organ); or from a too watery or otherwise diseased state of the blood (as in chlorosis, scurvy, Bright's disease, etc.). By means of the knowledge derived from pathological anatomy, we can often infer the cause from the seat of the swelling; for example, œdema of the face, usually commencing with the eyelids, is commonly caused by obstruction to the circulation through the left side of the heart, or by the diseased state of the blood in Bright's disease; and œdema of the lower extremities most commonly arises from obstruction in the right side of the heart, unless it can be traced to the pressure of the gravid uterus, or of accumulated fæces in the colon, or to some other local cause.

Active œdema is associated with an inflammatory action of the cellular tissue, and is most marked in certain forms of erysipelas. It is firmer to the touch, and pressure with the finger produces less pitting than in the passive form.

From the preceding remarks, it will be seen that œdema is not a disease, but a symptom, and ofen a symptom indicating great danger to life. The means of removing it must be directed to the morbid condition or cause of which it is the symptom.

OE'DENBURG, a co. in w. Hungary, bounded by Lower Austria, Raab, Eisenburg, and Wieselburg; 1280 sq.m.; pop. '70, 230,158; drained by the Raab, Leitha, and Rabuitz rivers, and intersected by the Vienna and Cilly railroad. Lake Neusiedler, one of the largest of Hungary proper, is included in the district. The surface is level and fertile in the s. and e., but mountainous in the n., and covered by forests. The staples are wine, tobacco, corn, wheat, honey, and wax. Potash, niter, refined sugar, cotton and woolen goods, are manufactured. Capital, Oedenburg.

OE'DENBURG (Hung. *Sovrony;* anc. *Sempronium*), a t. of Hungary, capital of a county of the same name, situated in an extensive plain, about 2 m. w. from the Neusiedler see, on the Ilkva, a branch of the Raab. It is connected by railway with Vienna. Oedenburg is one of the most beautiful towns in Hungary. It has manufactures of cotton and woolen goods, potash, nitre, tobacco, sugar, earthenware, glass, cutlery, etc.; and a considerable trade in wine, corn, tobacco, wax, honey, and cattle, the products of the neighborhood, which is rich and well cultivated. The wine of Rust, a small town 8 m. n. of Oedenburg, on hills sloping to the Neusiedler see, is one of the best wines of Hungary, and inferior only to Tokay. The Roman station of *Sempronium* was one of considerable importance; and numerous Roman remains are found near Oedenburg. The inhabitants of Oedenburg are mostly of German race. Pop. '69, 21,108.

Œ'DIPUS (Gr. *Oidipous*), the hero of a celebrated legend, which, though of the most revolting nature in itself, has supplied both Euripides and Sophocles with the subject-matter of some of their most celebrated tragedies. The story, as generally related, is as follows: Œdipus was the son of Laius, king of Thebes, by Jocaste; but his father having consulted the oracle to ascertain whether he should have any issue, was informed that his wife would bring forth a son, by whom he (Laius) should ultimately be slain. Determined to avert so terrible an omen, Laius ordered the son which Jocaste bare him to have his feet pierced through, and to be exposed to perish on Mount Cithæron. In this help-

less condition, Œdipus was discovered by a herdsman, and conveyed to the court of Polybus, king of Corinth, who, in allusion to the swollen feet of the child, named him *Œdipus* (from *oideo*, to swell, and *pous*, the foot); and along with his wife, Merope, brought him up as his own son. Having come to man's estate, Œdipus was one day taunted with the obscurity of his origin, and in consequence proceeded to Delphi, to consult the oracle. The response which he received was, that he would slay his father, and commit incest with his mother. To escape this fate, he avoided returning to Corinth, and proceeded to Thebes, on approaching which he encountered the chariot of his father; and the charioteer ordering him out of the way, a quarrel ensued, in which Œdipus ignorantly slew Laius, and thus unconsciously fulfilled the first part of the oracle. The famous Sphinx (q.v.) now appearrd near Thebes, and seating herself on a rock, propounded a riddle to every one who passed by, putting to death all who failed to solve it. The terror of the Thebans was extreme, and in despair they offered the kingdom, together with the hand of the queen, to the person who should be successful in delivering it from the monster. Œdipus came forward; the Sphinx asked him, "What being has four feet, two feet, and three feet; only one voice; but whose feet vary, and when it has most, is weakest?" Œdipus replied that it was "Man;" whereupon the Sphinx threw itself headlong from the rock. Œdipus now became king, and husband of his mother, Jocaste. From their incestuous union sprung Eteocles, Polynices, Antigone, and Ismene. A mysterious plague now devastated the country, and when the oracle declared that before it could be stayed, the murderer of Laius should be banished from the country. Œdipus was told by the prophet Tiresias that he himself had both murdered his father and committed incest with his mother. In his horror he put out his own eyes, that he might no more look upon his fellow-creatures, while Jocaste hanged herself. Driven from his throne by his sons and his brother-in-law, Creon, Œdipus wandered towards Attica, accompanied by Antigone, and took refuge in the grove of the Eumenides, who charitably removed him from earth; but the latter part of his life is differently told.

Œ'GIR, in Scandinavian mythology, the ocean god, a jotun, but friendly to Odin.

ŒHLENSCHLÄGER, Adam Gottlob, the greatest poet of northern Europe, was b. in 1779, at Copenhagen. His early years were spent at the palace of Fredericksborg, in the neighborhood of the Danish capital, where his father was employed, first as organist, and afterwards as steward or bailiff. During the absence of the royal family in the winter, Œhlenschlager and his sister amused themselves in roaming over the palace, and examining the paintings and works of art which it contained, and in improvising private theatricals, for which he supplied original pieces. After an irregular and desultory course of education, Œhlenschläger's love of the drama led him to offer his services to the manager of the Copenhagen theater; but, discovering soon that he had no chance of rising above the rank of a mere supernumerary, he entered the university of Copenhagen as a student of law. For a time he seems to have pursued his studies with tolerable assiduity, under the direction of his friend, A. S. Oersted, who, together with his distinguished brother, H. C. Oersted (q.v.), had cemented a life-long friendship with him. Œhlenschlager's studies were interrupted in 1801, when, on the bombardment of Copenhageu by Nelson and Parker, he and his friends served in the student-corps of volunteers. After this event, which roused the dormant patriotism of the nation, Œhlenschläger found the study of law too irksome, and devoted all his energies to the cultivation of the history and mythology of his own country. In 1803 appeared his first collection of poems, including one longer dramatic piece, *St. Hans Aften-Spil*, which attracted favorable notice for the lively fancy with which national habits and local characteristics were portrayed. The *Vaulunders Saga* in the *Poetiske Skrifter*, published in 1805, and his *Aladdin's forunderlige Lampe*, completed his success, and raised him to the rank of the first of living Danish poets; the former of these works having shown a marvelous capacity for reflecting the dark and stern coloring of the old northern Sagas, while the latter gave evidence of a rich and genial poetic fancy. These early efforts were rewarded by the acquisition of a traveling pension, which enabled him to spend some years in visiting various parts of the continent, and becoming acquainted with the great literary celebritias of the day, such as the Weimar circle, of whom Goethe was the head. During this period, Œhlenschläger wrote his *Hakon Jarl*, the first of his long series of northern tragedies, at Halle (1807; Eng. trans. by F. C. Lasceiles, (1875), and his *Coreggio*, at Rome (1809; Eng. trans. by Theodore Martin, 1854). In 1810 Œhlenschläger returned to Denmark, where he was hailed with acclamation as the greatest tragic poet Denmark had ever known; and having soon afterwards obtained the chair of æsthetics at the university, and received various substantial proofs of royal favor, he married, and settled in the capital, where his peace was, however, rudely disturbed by a literary feud with Baggesen, the Danish poet and critic, whose poetical supremacy had been superseded by that of Œhlenschläger. In 1819 appeared one of Œhlenschläger's most masterly productions, *Nordens Guder*, and this and the numerous dramatic compositions written about the same period, show that the severe criticism to which his writings had been exposed during the celebrated Bagessen quarrel, had corrected some of the faults, and lessened the self-conceit which had characterized his earlier works. His reputation spread with his increasing years both abroad and at home; and after having repeatedly visited the more

southern parts of Europe, he went, in 1829, to Sweden, where his arrival was welcomed by a public ovation; and after having received repeated marks of friendship from various sovereigns, he was honored in his own country by the celebration, in 1849, of a grand public festival, held in the palace at Copenhagen. But this ovation was unfortunately followed in less than two months by his death, which took place in Jan., 1850. His funeral was kept as a national solemnity, and he was followed to the grave by a civic procession, which included members of every class of society, from princes to artizans. The fame of Œhlenschläger will rest principally on his tragedies, of which he wrote 24, 19 of the number being on northern subjects. These were all composed originally in Danish, and re-written by himself in German. Besides those already referred to, the best are *Knud den Store*, *Palnatoke*, *Axel og Walborg*, *Væringerne i Miklagord*. His poems are for the most part indifferent, and his numerous prose writings deserve little notice. His Danish and German works amount in all to 62 volumes, to which must be added 4 volumes of his *Erindringer*, or *Autobiographical Recollections*, published after his death.

OEHLER, Gustav Friedrich, 1812–72, b. Würtemburg, and, having studied theology at Tübingen, was, 1834–37, a lecturer in the missionary institution at Basle, after which he returned to the theological seminary at Tübingen, teaching also in the university there. In 1840 he became vicar at Stuttgart and professor in the theological seminary at Schonthal. In 1845 he was chosen a member of the theological faculty at Breslau, and continued there until 1852, when he was called back to Tübingen where he lectured and was superintendent of the theological faculty. He published many essays and reviews, and several larger works. He was especially devoted to the study of the Old Testament for which he had a profound reverence as containing the commencement of the supernatural revelation which is completed in the New Testament. He held that the connection between the two is so intimate and essential that the genesis of all the New Testament ideas of salvation is found in the Old, and that the two must stand or fall together. His chief book is *The Theology of the Old Testament.*

ŒIL DE BŒUF, a French term literally signifying ox's eye, applied in architecture to those small round or oval openings in the frieze or roof of large buildings, which serve to give light to spaces otherwise dark. The most famous is that in the anteroom (where the courtiers waited) of the royal chamber at Versailles, which gave name to the apartment. Hence the expression, *Les Fastes de l'Œil-de-Bœuf*—i.e., the history of the courtiers of the Grand Monarque, and by extension, of courtiers in general.

Œ'LAND, a long and narrow island in the Baltic, lying off the eastern coast of Sweden, opposite to, and forming part of, the län of Kalmar, and at a distance of from 4 to 17 m. from the shore. It is 85 m. in length, and from 2 to 8.m. in breadth. The area is 588 sq.m., and the pop. 40,050. The island, which is scarcely more than a lime cliff, is scantily covered with soil, but in some parts it is well wooded, and has good pasture-ground, which is turned to account by the islanders, who rear cattle, horses, and sheep. In favorable seasons, barley, oats, and flax yield good crops. The fishing is excellent all round the coasts. There are large alum-works on the island, and an extensive line of wind-mills along the range of the Alwar hills, near which stands Borgholm (pop. 829), the only town on the island, the first foundations of which were laid in 1817. To the n. of the island lies the steep but wooded island-cliff, the Jungfruen, or Blaakulla, which bears the mythical reputation of having been the scene of various deeds of witchcraft, and the favorite resort of wizards and witches.

OELS, a small t. of Prussian Silesia, stands on a plain on the Oelsa, or Oelse, 16 m. e.n.e. of Breslau. Its castle, built in 1558, is surrounded by ramparts and ditches. It contains a gymnasium, several churches, and other public edifices. Pop. '80, 10,157, who carry on manufactures of shoes and of cloth goods.

ŒNANTHY'LIC ACID ($C_{14}H_{13}O_3,HO$) is one of the volatile fatty acids of the general formula $C_{2n}H_{2n}O_4$. It is a colorless oily fluid, with an aromatic odor, lighter than water, and insoluble in that fluid, but dissolving readily in alcohol and ether. According to Miller (*Organic Chemistry*, 2d ed. p. 355), it may be exposed to a cold of 0° without becoming solid; while it boils and may be distilled (with partial decomposition) at 298°. It is (like many of the allied fatty acids) one of the products of the oxidation of oleic acid (q.v.) by nitric acid, and is likewise yielded by the action of nitric acid on castor oil, wax, and various fats. Its most characteristic salt is the œnanthylate of copper, which crystalizes in beautiful green needles.

ŒNOTHE'RA, a genus of plants of the natural order *Onagraceæ* (q.v.), having four petals and eight stamens, the calyx-limb 4-cleft, the segments reflexed; the capsule 4-valved, with many naked seeds. The Evening Primrose (*Œ. biennis*), a native of Virginia, has been known in Europe since 1614, and is now naturalized in many parts of Europe and in some parts of Britain, on the banks of rivers, in thickets, on sandy grounds, etc. It is a biennial plant, and produces in the first year elliptic or obovate obtuse leaves, and in the second year a stem of 1½–4 ft. high, which bears at its summit numerous yellow flowers in a leafy spike. The flowers are fragrant in the evening. The root somewhat resembles a carrot in shape, but is short; it is usually red, fleshy and tender; it is eaten in salads or in soups, and as a boiled vegetable. The plant is often

cultivated for the sake of its large yellow flowers. Several other species of *Œnothera*, natives of North America, are occasionally cultivated in our gardens, and have eatable and pleasant roots.

OERE'BRO, an inland t. of Sweden, capital of a län of the same name, is situated at the entrance of the Swart-Elf into the Heilmar lake, 100 m. w. of Stockholm. Pop. '76, 10,496. The town still retains many memorials of its earlier prosperity, when it was frequently the residence of the Swedish rulers, who found its central position in the more fertile southern portion of the kingdom favorable both in regard to safety and pleasantness of site. The old castle was built by Berger Jarl in the 13th c., and was in after-times frequently chosen as the seat of the national diets. Oerebro has manufactories of wax-cloth, carpets, woolen goods, stockings, guns, and mirrors; and these industrial products, together with the minerals obtained from the neighboring silver, copper, and iron mines, are conveyed to Gothenborg and Stockholm by means of the extensive system of canals which connects the lakes of the interior with the maritime ports.

OERSTED, Anders Sandöe, 1778–1860; b. in the island of Langeland belonging to Denmark; was educated at the university of Copenhagen, embraced the profession of law and rose to eminence as a successful practitioner and as editor of the *Juridiskt Archir* and other legal periodicals; he also wrote several treatises on the philosophy of Kant and Hegel. In 1825 he was intrusted with the drawing up of the ordinances of the Danish law, and in 1831 had an important share in forming the provincial constitutions granted by Frederick VI. to the states. For several years he was high commissioner, or king's representative, at the assembly of the states, and from 1841 to 1848 was a member of the Danish cabinet. In 1853 he again entered the cabinet as prime minister of Frederic VII., and acted as minister of the interior, of public worship, and of public instruction. Up to this time he had been considered as favoring constitutional reform, but he soon showed himself a violent reactionist. Public feeling was very strong and a revolution seemed at hand, but at the close of 1854 the king dismissed the Oersted cabinet. The point on which the contest of liberalism and prerogative turned was the right of the crown to grant new constitutions to Sehleswig and Holstein without the consent of the diet. In 1855 Oersted and his colleagues in the cabinet were impeached by the diet; the trial lasted for a year and resulted in an acquittal under the Denmark law, the vote standing eight for conviction and eight for acquittal. An autobiography of Oersted was published 1851–57, and contains valuable material for Danish historians.

OERSTED, Hans Christian, one or the most distinguished scientific discoverers and physicists of modern times, was b. in 1777 at Rudkjobing, on the Danish island of Langeland, where his father practiced as an apothecary. In 1794 he entered the university of Copenhagen, where he took the degree of doctor of philosophy in 1799, and soon afterward became assistant to the professor of medicine, in which capacity he gave lectures on chemistry and natural philosophy. In 1806, after having enjoyed a traveling scholarship for several years, and visited Holland, the greater part of Germany, and Paris, he was appointed extraordinary professor of natural philosophy in the university of Copenhagen. In 1812, he again visited Germany and France, after having published a manual under the title of *Videnskaben our Naturen's Almindelige Love*, and *Förste Indledning til den Almindelige Naturlære* (1811). During his residence at Berlin, he wrote his famous essay on the identity of chemical and electrical forces, in which he first developed the ideas on which were based his great discovery of the intimate connection existing between magnetism and electricity and galvanism—a treatise which, during his residence in Paris, he translated into French, in conjunction with Marcel de Serres. In 1819, he made known these important truths in a Latin essay, entitled *Experimenta circa efficaciam Conflictus Electrici in acum Magneticam*, which he addressed to all the scientific societies and the leading savans of Europe and America, and thus made good his claim to be regarded as the originator of the new science of electro-magnetism. This discovery which formed one of the most important eras in the history of modern physical science, obtained for Oersted the Copley medal from the royal society of England, and the principal mathematical prize in the gift of the institute of Paris. The original and leading idea of this great discovery had been in his mind since 1800, when the discovery of the galvanic battery by Volta had first led him to enter upon a course of experiments on the production of galvanic electricity. The enunciation of his theory of electro-magnetism was followed by many important experiments in regard to the compression of water, and by numerous other chemical discoveries, among which we may instance his demonstration of the existence of the metal aluminium in alumina. The influence which Oersted exerted on the science of the day by his discoveries was recognized by the learned in every country, and honors increased upon him with increasing years. He was corresponding member of the French institute, perpetual secretary to the royal society of sciences in Copenhagen, a knight of the Prussian order of merit, of the French legion of honor, and of the Danish order of the dannebrog, and a councilor of state. Oersted's great object through life was to make science popular among all classes, in furtherance of which he wrote numerous works, contributed scientific papers to the newspapers and magazines of his own country and Germany, and in addition to his regular prelections in the university, gave courses of popular scientific lectures to the public including ladies. Among the works specially written to promote the diffusion of scientific knowl-

edge, those best known are *Aanden i Naturen* (Kop. 1845), and *Natur-læren's Mehanische Deel* (Kop. 1847), both of which have been translated into several other European languages. The majority of his more important physical and chemical papers are contained in Poggendorff's *Annalen*, and were written by him in German or French, both of which he wrote with the same facility as his own language. At the close of 1850, a national jubilee was held in honor of the 50th anniversary of his connection with the university of Copenhagen—a festival which he did not long survive, as his death occurred at Copenhagen Mar. 9, 1851. A public funeral, attended by all persons distinguished by rank or learning in the Danish capital, bore testimony to the respect and esteem with which he was regarded by his fellow-citizens, among whom his memory is cherished, not merely as one of the greatest scientific benefactors of his times, but as a man who contributed largely, by his eloquent and earnest advocacy of liberal principles, to the attainment of the high degree of constitutional freedom which Denmark now enjoys.

OE'SEL, an island of Russia, in the Baltic, belonging to the government of Livonia, and lying across the mouth of the gulf of Riga. It is about 80 m. in length from n.e. to s.w., and about 40 m. in greatest breadth, but the s.w. end consists of a comparatively narrow peninsula. A narrow strait separates the n.e. end from the island of Dago. The surface is undulating, broken by low hills, marshy, watered by numerous small streams, and well wooded. The coast is generally formed by high cliffs. The climate is milder than that of the neighboring continental districts. The rocks are generally calcareous, and the soil is in many places gravelly; the chief crops are wheat, oats, rye, barley, and pease. The rearing of cattle, horses, and sheep, and fishing, are, however, the principal occupations of the inhabitants. The seal-fisheries are of some importance. Pop. 48,000, mostly Lutheran. The only town is Arensburg, on the s.e. coast, with a pop. (1880) of 3,460. Many of the inhabitants of Arensburg are of German descent, as are the nobles and clergy of the island; but the peasantry are Esthonian. The islanders of Oesel were in early times noted as pirates. The Danish king Waldemar conquered the island in the beginning of the 13th century. Albert von Buxhövden, bishop of Leal in Livonia, obtained it from Denmark in 1227, in order that he might reduce its inhabitants to subjection, and convert them to Christianity. Being partly subdued by the Teutonic knights, it remained for more than 300 years under its bishops, the seat of the bishopric being transferred to the island. The last bishop sold it to Denmark in 1559. It remained a Danish province till 1645, when it was given up to Sweden, and in 1721 fell into the hands of Russia.

ŒSOPH'AGUS (Gr. *oio*, to convey, and *phagein*, to eat), or GULLET, a membranous canal, about 9 in. in length, extending from the pharynx to the stomach, and thus forming a part of the alimentary canal. It commences at the lower border of the cricoid cartilage of the larynx, descends in a nearly vertical direction along the front of the spine, passes through an opening in the diaphragm, and thus enters the abdomen, and terminates in the cardiac orifice of the stomach opposite the ninth dorsal vertebra. It has three coats—viz., an external or muscular coat (consisting of two strata of fibers of considerable thickness—an external, longitudinal, and an internal, circular); an internal or mucous coat, which is covered with a thick layer of squamous epithelium; and an intermediate cellular coat, uniting the muscular and mucous coats. In this tissue are a large number of œsophageal glands, which open upon the surface by a long excretory duct, and are most numerous round the cardiac orifice, where they form a complete ring.

The œsophagus is liable to a considerable number of morbid changes, none of which are, however, of very common occurrence.

The most prominent symtom of *œsophagitis*, or *inflammation of the œsophagus*, is pain between the shoulders, or behind the trachea or sternum, augmented in deglutition, which is usually more or less difficult, and sometimes impossible. The affection is regarded as a very rare one, unless when it originates from the direct application of irritating or very hot substances, or from mechanical violence—as, for instance, from the unskillful application of the stomach-pump or probang. Dr. Copland, however, is of opinion that it is not unfrequent in children, particularly during infancy, and observes that "when the milk is thrown up unchanged, we should always suspect the existence of inflammation of the œsophagus." The ordinary treatment employed in inflammatory diseases must be adopted; and if inability to swallow exists, nourishing liquids, such as strong beef-tea, must be injected into the lower bowel.

Spasm of the œsophagus—a morbid muscular contraction of the tube, producing more or less difficulty of swallowing—is a much more common affection than inflammation. The spasm generally comes on suddenly during a meal. Upon an attempt to swallow, the food is arrested, and is either immediately rejected with considerable force, or is retained for a time, and then brought up by regurgitation; the former happening when the contraction takes place in the upper part of the canal, and the latter when it is near the lower part. In some cases, solids can be swallowed, while liquids excite spasm; while in other cases the opposite is observed; but in general either solids or liquids suffice to excite the contraction, when a predisposition to it exists. The predisposition usually consists in an excitable state of the nervous system, such as exists in hysteria, hypochondriasis, and

generally in a debilitated condition of the body. An attack may consist of a single paroxysm, lasting only a few hours, or it may be more or less persistent for months or even years. The treatment must be directed to the establishment of the general health, by the administration of tonics and anti-spasmodics, by attention to the bowels and the various secretions, by exercise in the open air, the shower-bath, a nutritious diet, etc.; and by the avoidance of the excessive use of strong tea, coffee, and tobacco. Care must also be taken not to swallow anything imperfectly masticated or too hot; and the occasional passage of a bougie is recommended. Brodie relates a case that ceased spontaneously on the removal of bleeding piles. Strychnia is deserving of a trial when other means fail; and if the affection assume a decidedly periodic form, quinia will usually prove an effectual remedy.

Paralysis of the œsophagus is present in certain forms of organic disease of the brain or spinal cord which are seldom amenable to treatment, and is often a very important part of the palsy that so frequently occurs in the most severe and chronic cases of insanity. In this affection there is inability to swallow, but no pain or other symptom of spasm; and a bougie may be passed without obstruction. The patient must be fed by the stomach-pump, and nutrient injections of strong beef-tea should be thrown into the lower bowel.

Permanent or organic stricture of the œsophagus may arise from inflammatory thickening and induration of its coats, or from scirrhous and other formations, situated either in the walls of or external to the tube. The most common seat of this affection is at its upper part. The symptoms are persistent and gradually increasing difficulty of swallowing, occasionally aggravated by fits of spasm; and a bougie, when passed, always meets with resistance at the same spot. When the contraction is due to inflammatory thickening, it may arise from the abuse of alcoholic drinks, or from swallowing boiling or corrosive fluids; and it is said that it has been induced by violent retching in sea-sickness. If unrelieved, the disease must prove fatal, either by ulceration of the tube around the seat of the stricture, or by sheer starvation. When the affection originates in inflammation, some advantage may be derived from a mild course of mercury, occasional leeching, and narcotics; and especially from the occasional passage of a bougie, of a ball-probang (an ivory ball attached to a piece of whalebone), or of a piece of sponge moistened with a weak solution of nitrate of silver. If it is dependent upon malignant disease, and the tissues have become softened by the infiltration of the morbid deposit, the bougie must be directed with the greatest care through the stricture, as a false passage may be easily made into important adjacent cavities.

Foreign bodies not very unfrequently pass into the œsophagus, and become impacted there, giving rise to a sense of choking and fits of suffocative cough, especially when they are seated in its upper part. They may not only cause immediate death by exciting spasm of the glottis, but if allowed to remain, may excite ulceration of the parts, and thus cause death by exhaustion. If the body is small and sharp (a fish-bone, for example), it may often be got rid of by making the patient swallow a large mouthful of bread; if it is large and soft (such as too large a mouthful of meat), it may generally be pushed down into the stomach with the probang; while large hard bodies (such as pieces of bone) should be brought up either by the action of an emetic, or by long curved forceps. If the offending body can neither be brought up nor pushed down, it must be extracted by the operation of *œsophagotomy*—an operation which can only be performed when the impacted body is not very low down, and which it is unnecessary to describe in these pages.

Œ'STRIDÆ, a family of dipterous insects, having a mere rudimentary proboscis or none, the palpi also sometimes wanting, and the mouth reduced to three tubercles; the antennæ short and inclosed in a cavity in the forepart of the head; the abdomen large. They are generally very hairy, the hair often colored in rings. They resemble flesh-flies in their general appearance, and are nearly allied to *muscidæ*. The perfect insect is very short-lived. The females deposit their eggs on different species of herbivorous mammalia, each insect being limited to a particular kind of quadruped, and selecting for its eggs a situation on the animal suitable to the habits of the larva, which are different in different species, although the larvæ of all the species are parasites of herbivorous quadrupeds. The characters and habits of some of the most notable species are described in the article Bot. Animals seem generally to have a strong instinctive dread of the œstridæ which infest them.

OETINGER, Friedrich Christoph, 1702–82; b. Göppingen, in Würtemberg; studied at the university of Tübingen, where he met those who styled themselves the *inspired*, and devoted himself to the mystical philosophy of Leibnitz and Wolf. After finishing his course at the university he became intimate with Bengel, with whom he corresponded and whom he frequently visited. His aim was to infuse more of the biblical element into the philosophy of Wolf, and to "ascertain therein the final principles and highest unity of all thought." He read carefully the church fathers, especially Augustine, and studied the Rabbins and their cabalistic speculations. He became acquainted with Francke, Spangenberg, and Zinzendorf. After traveling extensively he returned to Tübingen, where, having served as tutor and aided Zinzendorf in the translation of the Scriptures, he was appointed reader of theology in the university of Halle. This

post he resigned, and went to Holland to confer with its eminent theologians. Returning to Würtemberg he was appointed in 1738 pastor at Hirschau. Having adopted the views of the Pietists, "with whom his purity of life, earnestness of manner, extensive theological aequirements, and, perhaps, his mysticism of style, all combined to give him great influence," he became their leader in that part of Germany. About this time he became an earnest student of the writings of the mystic Böhme, and also an ardent disciple of Emanuel Swedenborg, some of whose writings he translated into German. He attempted to arrange a system of theology on the mystical interpretation of Scripture. In 1765 he published a treatise entitled *Earthly and Heavenly Philosophy*, which, with his translation of the works of Swedenborg, brought upon him the reprehension of his ecclesiastical superiors. Yet he was protected by the duke of Würtemberg, and was nominated to the superintendence of the churches in the district of Weinsberg, afterward in that of Herrenberg, and subsequently appointed prelate at Murhard, where he continued till his death. He was held in high regard as a philosopher and theologian by those who adopted his views. He wrote several philosophical and cabalistic works, and spent much time in studying the art of transmuting metals. His autobiography was published at Stuttgart in 1845, and a complete edition of his works was collected and edited in 1852 by Ehmann, who published his life and letters. The works of Oetinger amount to about seventy, the best of which is *Theologia ex Idea Vitæ Deducta.*

OETTINGEN, a former German co. in the Riesgau, Swabia, now divided between the Spielberg and Wallenstein lines, and belonging partly to Würtemberg and partly to Bavaria. It existed from about 1200, and was mediatized 1806–10.

O'FALLON, John, b. Ky., 1791; served in the war of 1812 under gen. Harrison, being wounded at Tippecanoe; was a merchant of St. Louis, Mo., where he acquired vast wealth, and contributed more than a million dollars to charitable and other institutions, among which is the O'Fallon polytechnic institution, which he endowed to the amount of $100,000.

O'FARRELL, M. J., D.D. See page 894.

OFEN. See Buda, *ante.*

OF'FA'S DYKE, a remarkable relic of antiquity, an entrenchment extending along the whole border of England and Wales, from the n. coast of Flintshire, on the estuary of the Dee, through the counties of Denbigh, Montgomery, Salop, Radnor, and Hereford, into Gloucestershire, where its southern termination is near the mouth of the Wye, in the grounds of Sedbury park, which overlook the estuary of the Severn. In some places it is nearly obliterated by cultivation; in others it is of considerable height, although its appearance nowhere indicates that it can ever have been of much value as a rampart. It is therefore generally supposed to have been chiefly intended as a line of demarcation. Nearly parallel with it, but at a distance varying from a few hundred yards to 3 m., on the eastern or English side of it, is *Watt's dyke*, a similar relic of antiquity, which, however, seems never to have been so great a work, and is now in many places much obliterated. It has been conjectured that the space between them was neutral ground where the Anglo-Saxons and Welsh met for trading or other purposes. The principal dyke is ascribed by tradition to Offa, king of Mercia, who reigned in the 8th c.; but this is matter of tradition, and not of history.

OFF'ENBACH, a manufacturing t. of Hesse-Darmstadt, on the s. bank of the river Main, within the domains of the princes of Isenburg-Birstein, 4 m. s.e. of Frankfurt. Pop. '80, 28,449. Offenbach is pleasantly situated in one of the richest parts of the valley of the Main, and is one of the most important manufacturing towns in the province. Among the industrial products, its carriages have acquired a pre-eminent character for excellence; and next to these stand its bookbindings, articles of jewelry, gold and silver goods, carpets, and silk fabrics. It has also good manufactories of wax-cloth, papier-mâché snuff-boxes, tin-lackered wares, umbrellas and parasols, wax-candles, leather, hats, tobacco, sugar, and ginger-bread and spiced cakes. Offenbach has several churches, and a Jewish synagogue. The palace is the winter residence of the Isenburg-Birstein family, to whom the old castle, now in ruins, also belongs. A pontoon-bridge across the river, and a railway to Frankfurt, facilitate intercommunication, and tend materially towards the maintenance of its active trade.

OFFENBACH, Jacques, a composer of dramatic music, who gained high popularity over the continent, of German birth, but a naturalized Frenchman. He was born in 1819, became *chef d'orchestre* in the Théâtre Français in Paris in 1847, and afterwards manager of the Théâtre des Bouffes Parisiens. O. was composer of a vast number of light lively operettas, *Le Mariage aux Lanternes; La Fille d'Elezondo*, etc., perfect as musical trifles; but the productions by which he is best known are a series of *buffonneries musicales*, or burlesque operas, including *Orphée aux Enfers; La Belle Hélène; La Barbe Bleu; La Grande Duchesse; Geneviève de Brabant*, and *Roi Carotte*, composed with the rather questionable aim of parodying music of a more serious description. *Madame Favart* has become almost as popular in England as in France. He d. 1880.

OFFENSES Against Religion, Public Peace, etc. See Religion, Peace, etc.

OFFER and **ACCEPTANCE** is one mode of entering into a contract of sale. At an auction, the highest offer is generally accepted as a matter of course; and when accepted, the contract is completed. An offer is often made by letter from one merchant to

another to buy or sell goods. In such a case, the party offering is bound to wait until he gets an answer by return of post or messenger; for until then the offer is supposed to be continuously made. But if A offer to B personally to sell, and B ask time to consider for a day, or any given time, A is not bound to wait a single moment, according to English law, and may withdraw at any time from the offer, because he had no legal consideration for waiting; whereas, in Scotland, in the same circumstances, A would be bound to wait the time agreed upon.

OFFERING. Under the head FIRST-FRUITS (q.v.) have been described the various offerings prescribed in the Jewish law. We shall have occasion to consider, under the head of SACRIFICE (q.v.), some further questions connected with the subject of offerings in public worship. In the Christian community there appears to have existed, from the earliest times, a practice of making voluntary offerings, for purposes not directly connected with public worship. See OFFERTORY.

OFFERTORY (Lat. *offertorium*, from *offero*, I offer) is the name given to that portion of the public liturgy of the Roman Catholic church with which the eucharistic service, strictly so called, commences. In the Roman liturgy it consists of one or two verses from some book of Scripture, generally from the Old Testament, but sometimes also from the epistles. In the Ambrosian liturgy it consists of a prayer, similar in form to the *collect* or *secret* of the mass; and in both, this recital is followed by the preparatory offering up of the bread and wine, accompanied by certain ceremonies and forms of prayer.

This offering of the bread and wine in the public service became, from a very early period, the occasion of a voluntary offering, on the part of the faithful; originally, it would seem, of the bread and wine designed for the eucharistic celebration and for the communion of the priest and the congregation, sometimes even including the absent members, and also for the *agape*, or common sacred feast, which accompanied it. That portion of the offerings which remained in excess of what was requisite for these purposes was applied to the relief of the poor, and to the support of the clergy. These offerings were ordinarily made by the faithful in person, and were laid upon the altar; and the Ambrosian rite still preserves this usage in a ceremonial which may be witnessed in the cathedral of Milan. By degrees, other gifts were superadded to those of bread and wine—as of corn, oil, wax, honey, eggs, butter, fruits, lambs, fowl, and other animals; and eventually of equivalents in money or other objects of value. The last-named class of offerings, however, was not so commonly made upon the altar and during the public liturgy, as in the form of free gifts presented on the occasion of other ministerial services, as of baptism, marriages, funerals, etc.; and from this has arisen the practice in the Roman Catholic church of the mass-offering, or *honorarium*, which is given to a priest with the understanding that he shall offer the mass for the intention (whence the honorarium itself is often called an "intention") of the offerent. In some places, however, and among them in some parts of Ireland, offerings "in kind" are still in use, not indeed in the form of the ancient offertory, but in the shape of contributions of corn, hay, etc., at stated seasons, for the use of the parochial clergy. At weddings also, and in some places at funerals, offerings in money are made by the relations and friends of the newly married or of the deceased. In the liturgy of the English church allusion is made to the practice of oblations, and some of the recent controversies have turned upon the revival of the "offertory," which has found some advocates.

OFFICE, in law, may be ministerial or judicial, and is in law the right and duty of one or more persons to discharge the functions of some position of trust or honor, and to receive the emoluments appertaining thereto. An office is ministerial when its exercise depends on the command or direction of others; judicial, when the officer is called upon to employ his own discretion. An example of the first is a sheriff, of the second a judge of a court of law. The two are sometimes united in one. The office is held for the benefit of the public, may be abolished by legislation, unless such action be expressly forbidden by the constitution; and cannot be the subject of sale or devise, though in England certain ministerial offices are regarded as the property of the incumbent and may descend in the family. When the office is in its nature judicial, the duties cannot be performed by deputy, as the personal skill or judgment of the officer are the reasons for his holding the office. With ministerial offices the reverse is the case. Thus a sheriff or other court officer may appoint deputies, and their acts are good in law; while the appointing officer remains responsible for such acts. Statutes in most of the states provide that offices shall not be sold, and such a sale would be void anywhere as contrary to the policy of the common law. So any agreement between the officer and one who by influence procures his appointment, to divide the compensation received, would be altogether void. It was a principle of the common law that no term of office should be created so as to begin at a certain time in the future, nor for a fixed term of years, but should be held for life or during good behavior, This was to prevent the holding of office after competency to perform the duties had ceased, and to render it impossible that the office should survive the officer. It is common in this country to limit the term to the life of the incumbent and to the attaining of a certain age, as 70 years. Two offices cannot be held by the same person where one is in the nature of its duties inconsistent with the other. This inconsistency may be patent from the nature of the offices

or it may be declared to exist by act of legislation. Where an office is filled in common by several persons, it has been held that if the office is of a public character all the officers must meet for consultation, but that a majority may act, while if the office is private, all must concur; but this is often governed by statute, and a decision by a majority, or even a majority of those present at any meeting, made binding. Members of state or national legislature are not usually termed officers, the word being confined in usage to those having executive or judicial authority. A *de facto* officer is one who is in possession of the authority and emoluments of an office without a good title thereto, while a *de jure* officer is one who has the legal right but not necessarily actual possession. It is evident that it would make much confusion and cause great injustice if all official acts of a *de facto* officer were to be considered as of no effect. Thus, in the case of a judge who was wrongfully on the bench, it would be a great hardship if all judgments given by him, and all criminal convictions of his court, should be set aside. But if suit be brought by a *de facto* officer in his public capacity, he may be debarred from recovery on the ground of defect in title, and the *de jure* officer may test the question of title by bringing a writ of *quo warranto*.

Public officers are appointed in the United States, under the provisions of the constitution, by the president with the advice and consent of the senate, with the exception that to congress is given the power to vest in the president alone, or in the heads of departments or courts of law, the appointment of "inferior officers." Ambassadors, public ministers and consuls, and supreme court judges are specified as not belonging to this "inferior" class, but beyond that the distinction is not clearly defined. In the various states the appointment of public officers is regulated by statutes, and even in the case of supreme court judges election is common. The appointee in most cases is required to take an oath to perform faithfully the duties of the office. A bond is often required where the officer has charge of financial interests or his duties affect property rights. Where he performs official acts before giving bond or taking oath, such acts will be valid unless he has been specially prohibited by statute or constitution from holding the office before the bond was filed or the oath administered. Compensation of officers may be fixed by law or may be obtained from fees. It is provided in the United States statutes that no officer of the government who holds an office with a salary of $2,500 or more shall receive extra compensation for performing the duties of any other office unless expressly authorized by law. Where an officer has been removed his salary will continue until proper notice of the appointment of his successor has been given him. Compensation does not begin until an officer is liable to duty. The law will presume that a public officer is acting within the scope of his duty until the reverse has been shown. Where discretionary power is given, the officer is made the exclusive judge of the facts. The officer is liable for wrongful acts both to the injured party and to the state. In the first cast remedy is by action, in the second by indictment or impeachment. The order of a superior is no bar to an action arising from an unlawful act of the inferior, nor is negligence on the part of a subordinate ground for holding the head officer responsible. Contracts made by public officers are governed by the general law of agency and they cannot bind the government beyond the extent of their legal authority. If an appropriation is exceeded, the officer is liable. A court officer cannot be held if acting under the proper order of a court having jurisdiction, but may be where there is no jurisdiction. If a sheriff seize property which is by law exempt, he is personally responsible. Fraud and embezzlement are made criminal offenses by statute. Forfeiture of office will follow such offenses, the proceeding being by information or *quo warranto*. The method of removing a public officer is not provided for in the constitution, and the question arises whether the power belongs to the president alone or whether he must receive he consent of the senate. Such "inferior" officers as may be appointed by congress may also be removed by proper legislation. It is said on the one hand, as to other officers, that there is a distinction between the right to nominate and the power of appointment, and that therefore the consent of the senate must be obtained in removing any officers in whose appointment it had a share. On the other hand, it is urged that removal is an executive act, that the power of nominating implies the power to remove, and that the public interest demands that the president should have power to dismiss an incompetent or dishonest official without the delay which would be entailed by awaiting the action of the senate. The question has several times come before congress, and the power of the president to act alone was sustained by a very close vote. In the contest of authority between president Andrew Johnson and congress the discussion on this point was very bitter. By statutes of 1867 and 1869 it was provided that a civil officer appointed by the advice and consent of the senate shall hold his place until removed by the same authority, but that during a recess of the senate the president may suspend such officer and appoint another to fill the duties of the position. The president is to make a nomination within 30 days after the beginning of the next session of the senate; and in case the senate directly refuse to confirm, he may nominate another person. These statutes are known as the tenure-of-office acts. State officers may in many cases be removed by the governor; the subject is governed by statutory enactments, which vary greatly in the different states. Elective offices cannot be vacated by an executive officer without showing cause, such as malfeasance or embezzlement. A term of office may be extended or reduced by action of the legislature

unless it be prescribed by constitutional provision or be elective in its nature. Officers of the United States courts hold during good behavior, but those of the territorial courts do not fall within the clause of the constitution already referred to, and depend upon the action of congress for the limitation of their terms. If neither state nor national constitution prescribe the length of a term, the subject is under legislative control, and may be extended or shortened, or the office altogether abolished.

OFFICE, The Divine (Lat. *officium*, duty), is the name popularly given to the canonical hours (q.v.) prescribed to be read each day by bishops, priests, deacons, and subdeacons in the Roman Catholic church. Under the head Breviary will be found a general description of the contents and the arrangement of that great service-book. The special portions assigned for any particular day constitute what is called the divine office for that day; and each person who is bound in virtue of his order to recite the breviary, is obliged, under pain of sin, to read, not merely with the eye, but with distinct, although it may be silent, articulation, each and all these portions. The adjustment of the portions of the office of each day, the combination of the "ordinary" portions which are read every day in common, with the parts "proper" for each particular day, is a matter of considerable difficulty, and is regulated by a complicated system of rubrics (q.v.).

OFFICE COPY is a copy made of a document by some officer of a court in whose custody the document is; and in general such copies are receivable in evidence, without further proof, in the same court, but not in other courts, except some statute makes them evidence.

OFFICE FOUND. See Inquest of Office.

OFFICE, HOLY, Congregation of the. In the article inquisition (q.v.) it has been explained that that tribunal is sometimes called by the name holy office. That title, however, properly belongs to the "congregation" at Rome, to which the direction of the tribunal of the inquisition at Rome is subject. This congregation was established by Paul III. in 1542, and its organization was completed by Sixtus V. It consists of twelve cardinals, a commissary, consulters, and qualifiers, whose duty it is to examine and report on each case for the information of the cardinals. In the most solemn sessions of the holy office the pope himself presides in person. The holy office decides questions of heresy, inquires into crimes against faith, and judges ecclesiastical offenses, especially in the administration of the sacraments. In the present condition of the papal court the action of the holy office is much restricted.

OFFICERS, Military and Naval.—*Military officers* are combatant and non-combatant, the latter term, including paymasters, medical officers, commissariat, and other civil officers. The great divisions of rank are commissioned, warrant, and non-commissioned officers. Commissioned officers are those holding commissions from the crown, or a lord-lieutenant, and comprise all holding the rank of ensign, or corresponding or superior rank. Divided by duties, they are staff officers (see Staff), or regimental officers (see Regiment); divided by rank, general officers (q.v.), field officers (q.v.), and troop or company officers. The last are captains, lieutenants, and sub-lieutenants, and, except in the cavalry, are unmounted. The different systems of promotion for officers, and especially the intricacies of the late purchase system, will be explained under Promotion, Army, and Purchase System. The only warrant officers in the army are master-gunners (see Gunner) and schoolmasters. Non-commissioned officers are described under that heading.

Officers, naval, are commissioned, warrant, and petty officers. Commissioned officers are admirals, captains, commanders, lieutenants, and sub-lieutenants, described under their respective titles. Warrant officers (q.v.) are boatswains, carpenters, gunners, and one class of engineers. Petty officers will be described under that heading, and constitute a very important portion of the management in a ship-of-war.

OFFICIAL ASSIGNEE', in English law, is an offier of the bankruptcy court, in whom a bankrupt's estate vests the moment an adjudication of bankruptcy is made. He is the manager of the property, and can sell the estate under the directions of the court in urgent cases, such as where the goods are perishable; but, in general, he is assisted in the management by the creditor's assignees, who are selected from the body of creditors by the other creditors' votes. The official assignee is appointed by the lord chancellor, being selected from the body of merchants, brokers, or accountants. He is bound to find security to the extent of £6,000. He is prohibited from carrying on trade on his own account. The salary is £1000.

OFFICINAL PLANTS (Lat. *officina*, a shop) are those medicinal plants which have a place in the pharmacopœias of different countries, and which are therefore sold—or some of their products or preparations of them—by apothecaries and druggists. The medicinal plants cultivated to any considerable extent are all officinal, but many are also officinal which are not cultivated. See Medicinal Plants.

OFFSET, or Set-Off, the splay or sloping part of a wall, etc., joining parallel surfaces when the upper face recedes from the lower. This frequently occurs on buttresses. The

offset is usually protected with dressed stones, having a projection or drip on the lower edge to prevent the rain from running down the wall.

OFFSETS, a term used by gardeners to designate the young bulbs which, springing from the axils of the scales of a bulb (q.v.), grow beside it, exhausting its strength, but which serve for the propagation of the plant. A crop of shallots, or of potato onions, consists entirely of the offsets of the bulbs planted in spring; although the term is not commonly used except as to bulbous-rooted plants, prized for the beauty of their flowers.

OFFSETS. Let AEF....B....D....C be a field with very irregular sides; take the points A, O, M, C at or as near the corners as convenient, the object being to inclose as much of the field as possible within the quadrilateral AOMC; and for this purpose, it is sometimes necessary, as in the present case, to include a corner (as SRQ) which is outside the field. The area AOCD is found by means of the diagonal AM, and the perpendiculars on it from C and O. The area AEFG....BL is found by dividing it into triangles and trapezoids by means of perpendiculars (to which the term *offsets* was originally applied, though it now denotes the irregular area before mentioned) from the corners E, G, H, etc. (see TRIANGLE and TRAPEZOID), and adding together the areas of the separate figures AEF, FG*g*, GH*gh*, etc. Similarly the

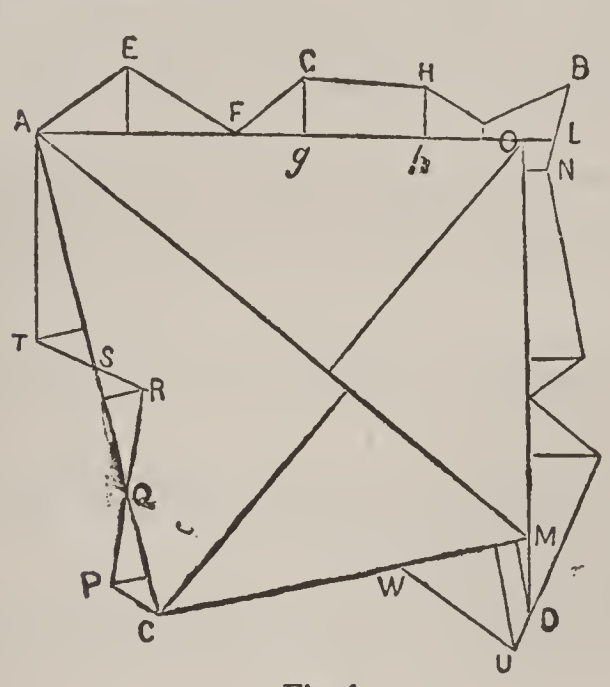


Fig. 1.

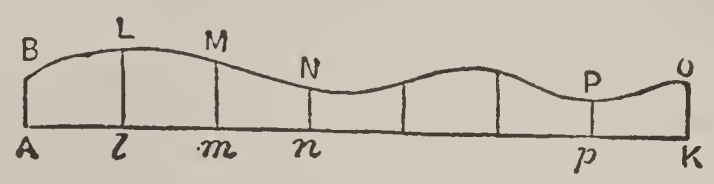

Fig. 2.

areas of OLN....D and MDUW are found. To the sum of these must be added the areas of the triangles ATS, QPC, diminished by the area of SRQ, and the result is the whole area of the field. If the offset have no distinct corners as (fig. 2) ABLMN....OK, then the base AK is divided into equal parts by perpendiculars AB*L*, M*m*, N*n*, etc., and the area of the offset is found approximately as follows: the whole offset = ABL*l* + L*l*M*m* + M*m*N*n* + etc. + P*p*OK = A*l* × ½ (AB + L*l*) + *lm* × ½ (L*l* + M*m*) + *mn* × ½ (M*m* + N*n*) + ... + *p*K × ½ (*p*P + OK) = (since the divisions of the base are equal) A*l* × ½ { AB + 2L*l* + 2M*m* + 2N*n* + ... + 2*p* P + OK } = A*l* × $\left\{\frac{\text{AB} + \text{OK}}{2} + \text{L}l + \text{M}m + \text{N}n + \ldots + \text{P}p\right\}$; i.e., the area of an offset is found approximately by adding the intermediate perpendiculars to the semi-sum of the first and last and multiplying the sum total by the length of a division of the base, the divisions being equal; and the greater the number of perpendiculars, the nearer the result is to the true area.

OG, an Amoritish king of Bashan. He reigned ever 60 cities, of which the chief were Ashtaroth and Edrei, at the time of the entrance of the Israelites into Canaan, B.C. 1618. He and his people were defeated and destroyed at Edrei immediately after the conquest of Sihon, his friend and ally. His walled cities were taken, and his kingdom, with its capital, transferred to the tribes east of the Jordan. He was one of the last of the race of the giants, and Scripture records the size of his iron bedstead preserved in "Rabbath of the children of Ammon," which was about 15 ft. long and 6 broad. This is supposed to have been one of the common flat beds used on the house-tops of eastern cities, but made of iron instead of palm-branches.

OGDEN, a village and co. seat of Weber co., Utah; on the Ogden river at the junction of the Weber river, and having importance as the place of intersection of the Union Pacific, Central Pacific, Utah Northern, and Utah Central railroads; pop. '80, 6,069. There are many machine and car shops, 3 national banks, and the place is the center of a country of some agricultural and mining importance.

OGDEN, AARON, LL.D., 1756–1839; b. Elizabethtown, N. J.; educated at Princeton college, where he graduated in 1773. In 1775 while engaged in teaching school he took part in the capture of a vessel containing supplies for the British troops off Sandy Hook. In 1777 he became a captain in the first New Jersey regiment, took part in the battle of Brandywine, and was made aid-de-camp to lord Stirling. In 1779 he was employed in the Indian campaign, and in 1781 commanded a regiment at Yorktown, where his gallantry received the personal commendation of Washington. At the close of the war he practiced law, held several minor offices, was elected United States senator from New Jersey in 1801, and in 1812 was governor of his state. He served in the Mexican war at the head of the New Jersey militia and was offered the rank of major-general, which he declined.

OGDEN, DAVID, 1707–1800; b. N. J., graduated at Yale college, class of 1728; studied law in New York city, rose rapidly in his profession, and attained great distinc- into in his native state. He was called one of the "giants of the law." In 1772 he was appointed judge of the supreme court, and inclined toward the opinions of the loyalists during the disturbances preceding the revolution, though disposed to assist in an amicable settlement, and originated a plan for the government of the colonies in case they should submit to the authority of Great Britain. His wavering ending in toryism, his property was confiscated, and in 1776 he removed to New York, joined the refugees, became a member of the board, and in 1783 went to England for a few years, returning to his native land in 1790, and died in Queens co., Long Island. Of his sons, one, Abraham, became a distinguished lawyer and United States district attorney under president Washington, and Isaac was judge of the court of king's bench.

***OG'DENSBURG**, a city and port of entry in New York, on the south bank of the river St. Lawrence, at the mouth of the Oswegatchie, 210 m. n.w. of Albany, and at the western terminus of the northern railway. It has a large lake and river trade, mills, and factories, custom-house, town-hall, etc., and a steam-ferry to Prescott, Canada. Pop. in 1860, 7,410; in 1870, 10,076. See *Supp.*, page 894.

OGEE', a molding consisting of two curves, one concave and the other convex. It is called (in classic architecture) *cymatium* or *cyma reversa* (see MOULDING). The ogee is also much used in Gothic architecture. An arch having each side formed with two contrasted curves is called an ogee arch.

OGEE'CHEE LIME, *Nyssa capitata*, a small tree; found in Georgia, Alabama, and other southern states. It belongs to the order *cornaceæ*, and takes its name from the fruit, which is small and sour, but edible.

OGEMAW, a co. in n.e. Michigan; watered by Rifle river, on the Mackinaw branch of the Michigan Central railroad; 576 sq.m.; pop., '80, 1914—1156 of American birth. The surface is rolling, and well wooded. Co. seat, West Branch.

O'GHAMS, the name given to the letters or signs of a secret alphabet long in use among the Irish and some other Celtic nations. Neither the origin nor the meaning of the name has been satisfactorily explained.

The alphabet itself is called *bethluisnin*, or *bethluis*, from its first two letters, "*b*," called "*beith*" (birch), and "*l*," called "*luis*" (quicken). Its characters are lines, or groups of lines, deriving their significance from their position on a single stem or chief line—over, under, or through which they are drawn either straight or oblique. In some cases, the edge of the stone or other substance on which the oghams are incised, serves the purpose of the stem or chief line. About eighty different forms of the alphabet are known. Five characters were afterwards added to represent diphthongs. The sign for the diphthong "*ea*" is said to be the only one which has been observed on ancient monuments. It is added that the sign for "*ui*" sometimes stands for "*y*," that the sign for "*ia*" sometimes stands for "*p*," and that the sign for "*ae*" stands also for "*x*," for "*cc*," for "*ch*," for "*ach*," and for "*uch*."

Ogham inscriptions generally begin from the bottom, and are read upward from left to right to the top, when they are carried over, and run down another side or angle. Most of those which have been read give merely a proper name with its patronymic, both in the genitive case. The stones on which oghams are cut would seem, for the most part, to have been sepulchral. Oghams are of most frequent occurrence in Ireland, where they are found both written on books and inscribed on stones, metals, or bones. The oghams on stones are most numerous in the counties of Kerry and Cork. A few ogham inscriptions on stones have been discovered in Wales—as at St. Dogmael's, in Pembrokeshire; near Margam, in Glamorganshire; and near Crickhowel, in Brecknockshire. There are a few in Scotland, as on the Newton stone and the Logie stone in Aberdeenshire, on the Golspie stone in Sutherland, and on the Bressay stone in Shetland. One has been found in England—at Fardel, in Devonshire. Oghams have been observed on an ancient MS. of Priscian, which belonged to the famous Swiss monastery founded in the 7th c. by the Irish missionary St. Gall (q.v.).

The difficulties of deciphering ogham inscriptions cannot be said to have been as yet altogether overcome. It is confessed by the most learned and judicious of ogham scholars, the Rev. Charles Graves, D.D., of Trinity college, Dublin, that the nature of the character is such that it does not at once appear which, of four different ways of reading, is the right one; that the words being written continuously, as in ancient MSS., there is great chance of error in dividing them; and that the Celtic names inscribed are generally Latinized in such a manner as not readily to be recognized.

The old school of Irish antiquaries contended that the oghams were of Persian or Phenician origin, and were in use in Ireland long before the introduction of Christianity. But this theory is now generally discarded, as not only unsupported, but as contradicted by facts. A comparison of the Ogham alphabet with the alphabets of Persepolis and Carthage shows that there is no likeness between them. The great majority of ogham monuments, it has been observed, bear more or less distinct marks of Christian hands.

Several are inscribed with crosses, as old, to all appearance, as the oghams themselves. Many stand in Christian burying-grounds, or beside Christian cells or oratories. Some still bear the names of primitive saints. At least one is inscribed with a Christian name; and some of the inscriptions betray an undeniable knowledge of Latin. At the same time, it has been argued by one of the most learned of Celtic philologists, Mr. Whitely Stokes, that "the circumstance that genuine ogham inscriptions exists both in Ireland and in Wales which present grammatical forms agreeing with those of the Gaulish linguistic monuments, is enough to show that some of the Celts of the islands wrote their language before the 5th c., the time at which Christianity is supposed to have been introduced into Ireland. It has been observed by Dr. Graves, on the other hand, that there are many points of resemblance between the oghams of the Celts and the Runes of the Norsemen; and, indeed, one Irish MS. asserts that the oghams came to Ireland from Scandinavia:

> "Hither was brought, in the sword sheath of Lochlan's king.
> The ogham across the sea. It was his own hand that cut it."

The ogham is said to have been in use so recently as the middle of the 17th c., when it was employed in the correspondence between king Charles I. and the earl of Glamorgan.

The best account of oghams is in the papers in the *Transactions of the Royal Irish Academy*, by Dr. Graves, now bishop of Limerick, vol. iv. pp. 70, 173, 183, 254; vol. v. pp. 234, 401; vol. vi. pp. 71, 209, 248, where also are some papers of value on the same subject by Mr. Samuel Fergusson; and the *Catalogue of the Museum of the Royal Irish Academy*, pp. 134–140; and in Mr. Whitley Stokes's *Three Irish Glossaries*, pp. 55–57, compared with Thomas Innes's *Critical Essay on the Ancient Inhabitants of Scotland*, vol. ii. pp. 440–466. The reader may also consult with advantage Astle's *Origin and Progress of Writing;* Petrie's *Essay on the Round Towers of Ireland;* John Stuart's *Sculptured Stones of Scotland*, and Ware's *Antiquities of Ireland.* Ogham inscriptions may be seen in the museum of the royal Irish academy at Dublin, in the museum of the society of antiquaries of Scotland at Edinburgh, and in the British museum at London.

OGILBY, John, 1600–76; b. Scotland; resided in London. In 1633 he went to Ireland in the employ of Wentworth, earl of Strafford, then deputy of Ireland, pursuing his vocation of copyist and his profession of dancing-master. About 1650 he studied Greek and published a poetical translation of Virgil, 1649–50. He conducted the poetical exercises at the coronation pageant in 1661 which attended the restoration of Charles II. to the throne, and erected a printing-office in the city of London in 1667. Associated with James Shirley, the dramatist, he translated the *Iliad*, 1660; and the *Odyssey* into English verse, 1665, the typography of which was considered very elegant. He translated the works of Montanus, a native of Phrygia, the founder of a Christian sect of the 2d century. His works were splendidly illustrated by Hollar, the Bohemian engraver and designer. It was from his Homer that Pope, in his boyhood, drew the inspiration for his own classical work. In 1670 he published *America, containing the Original of the Inhabitants and the Remarkable Voyages thither*, havin 57 folding plates and maps, exclusive of those inserted in the text, among which is "the earliest view" of Nieue Amsterdam (New York). He was appointed royal cosmographer, and published many maps and geographical works; among them *Atlas Japanensis*, 1670, *Atlas Chinensis* 1671–73, *Britannia*, etc.

OGILBY, John D., d.d., about 1808–51; an Episcopal clergyman, in 1829 became rector of the grammar school of Columbia college, New York, from which institution he had graduated in that year, and held the position 12 months. In 1832 he became professor of languages at Rutgers college, New Brunswick, N. J. He filled the chair of professor of ecclesiastical history in the general theological seminary of the Episcopal church in New York from 1841 to the time of his death, which tock place in Paris. He published in 1842 *An Outline of the Argument against the Validity of Lay Baptism;* and in 1844, *The Catholic Church in England and America.*

O'GIVES, the arches in pointed Gothic vaulting which cross the vault diagonally from one angle to another.

OGLE, a co. in n. Illinois, drained by Rock river, Leaf river, and Pine creek; on the Chicago and Northwestern, Chicago and Iowa, and Illinois Central railroads; 750 sq.m.; pop. '80, 29,946—25,432 of American birth. The surface is rolling and the soil fertile with much prairie. The principal productions are corn, wheat, hay, barley, and potatoes. Co. seat, Oregon.

OGLE, Benjamin, 1749–1809; b. Md.; member of the Maryland council, and governor of that state 1798–1801.

OGLESBY, Richard James; b. Ky., 1824; studied law while living on a farm and working as a carpenter at Decatur, Ill.; and commenced the practice of law at Sullivan in 1845. He was a soldier of the Mexican war, and at the battles of Vera Cruz and Cerro Gordo served as lieut. in the 4th regiment Ill. volunteers. In 1847 he went back to Decatur and the practice of his profession, studying at the same time at the Louisville law school, graduating in 1848. In the gold excitement of 1849 he crossed the continent to the mining districts of California, returned in 1851 to Illinois, went to Decatur

and resumed the practice of law. In 1858 he was a defeated candidate for congress, but in 1860 he represented his district in the state senate. When the rebellion broke out in 1861 he resigned his seat to accept the position of col. of the 8th Ill. volunteers, and on March 21, 1862, was promoted to brig.gen. of volunteers for bravery at the battle of fort Donelson, in which action he commanded a brigade. He was in the battle of Shiloh, or Pittsburg Landing, under gen. Grant, and was wounded at the siege of Corinth, where he fought under gens. Halleck and Rosecrans, ending in the defeat of the confederates. He was unfit for duty until the following spring, when he was assigned to the 16th army corps as maj.gen. In May, 1864, he resigned his commission, and in the following November was elected governor of Illinois, and served from 1865 to 1869. In 1872 he was again elected governor, and was U. S. senator 1873–79.

OGLETHORPE, a co. in n.e. Georgia, bounded by Oconee river on the s.w., and Broad river on the n.e.; drained by many creeks; intersected by the Athens branch of the Georgia railroad; 520 sq.m.; pop. '80, 15,400—15,369 of American birth, 9,934 colored. Surface broken and hilly and only moderately fertile; corn, cotton, and pork are the staples. Iron ore and granite are found. Co. seat, Lexington.

OGLETHORPE, James Edward, 1696–1785; b. England; entered Oxford in 1714, but soon afterwards accepted a commission in the queen's guards, and went through the Turkish campaign of 1716 as an aid-de-camp of prince Eugene. He participated in the siege of Belgrade, and in 1722 returned to England and entered parliament. Having been appointed a trustee for the relief of insolvent debtors, he conceived a plan for the formation of a colony in America to improve their condition, and to afford a refuge for the persecuted Protestants of Europe. The unsettled country between Florida and South Carolina was selected as a site, and the government made a grant of £10,000. The colony received a charter, and in 1733 Oglethorpe, who was appointed governor, took out a party of colonists to Georgia. For his subsequent connection with the colony, see Georgia, *ante*. In 1745 he was made a maj.gen., and after the invasion of the Pretender was ordered to pursue the rebels, and for his failure to overtake them was court-martialed, but acquitted. In 1752 he surrendered the charter of Georgia to the government, and in 1754 he resigned his seat in parliament. He was made lieut.gen. in 1747, and put upon half pay as gen. in 1765. He was offered the command of the British forces in America upon the withdrawal of Gage in 1775. He was eulogized by Pope, by Dr. Johnson, and by Thomson. The *Memoirs of James Oglethorpe*, by Robert Wright, appeared at London in 1867.

O'GOBAI, or Ogowé, a large river of western Africa, in the district between the Gaboon and Congo, which falls into the sea by many mouths, between s. lat. 0° 40′ and 1° 20′. Its delta is not less than 1300 sq.m. in extent, and consists of a most complicated network of channels and creeks, with two main branches, the most northerly of which reaches the sea at Nazareth bay; the other principal mouth, the Bango or Fernand Vaz, about 50 m. further s., has its outlet at the lagoon of Cama or Ncomi. The researches of Du Chaillu, its first explorer, in 1856 and 1865; of Walker in 1866 and 1873; of Compiègne, Marche, and Dr. Lenz in 1874, and in 1875–78 of M. Savorgnan de Brazza and Dr. Ballay, have all helped to increase our knowledge of this region. About 60 m. inland, above the head of the delta, the Ogobai flows for a distance of about 50 m. from the eastward, its average width being about 2,500 yards. It then bends n. for 15 m., and here occurs the junction of the Okanda river, from the n.e., with the Ngunie from the south. The bed of the main stream, the Okanda, is from 800 to 1000 yds. wide above the confluence, with a series of rapids on its upper waters, at a distance of 180 m. from the sea. In addition to a French commercial establishment on the lower river, there is a British and Hamburg station at Adelina Longa, below the Ngunie. This latter district is distinguished by numerous lakes, one of which, 15 m. long by 7 broad, is connected with the Ogobai by three rivers. Lake Azingo, to the n., is connected with the Ogobai by the river Koli. In 1875 M. de Brazza was at Lopé, and explored the Fan country; he then advanced to Doumé, 50 m. s. of the equator, where the course of the river is from the s.e. to the n.w. Interrupted by illness, he resumed his explorations in April, 1877, advancing to the Poubara falls, in 1° 45′ s., where the Ogobai becomes an insignificant stream. Traveling eastward into unknown country, he crossed the water-parting, and discovered the Alima, a hitherto unknown river, which he found to be 150 yards wide, flowing eastward, and in all probability a tributary of the Congo. The region between the Ogobai and Alima is 50 m. across, and consists of hills of moderate height, with easy passes. The dense forests of the Ogobai are the main haunts of the gorilla (q.v.), and of several other anthropoid apes, amongst which are the nest-building apes (q.v.). S. of the Ogobai dwell the Ashira and Apingi tribes, the latter being skillful weavers, though cannibals; between the Ogobai and the Gaboon are the Fans, first fully described by Du Chaillu, who are also cannibals, and have been moving westwards for some years, so that the whole Gaboon region is occupied by them. The Fans excel in smith-work, but they have deteriorated since their contact with the whites. Next in importance to the Fans are the Bakalai, inhabiting the country around the confluence of the Ogobai and the Ngunie. Amongst the other tribes on the upper waters are the Okota, Osyeba (cannibals), and the Okanda. The rise of

the Ogobai corresponds with the heaviest rainfall, which takes place in March and April, and again in October and November. Inland, rain is more frequent than at the coast. The Ogobai seems to gather most of its volume from lands comparatively near the coast, and not to depend greatly on more remote tributaries.

OGY'GES, the earliest king of Attica and Bœotia named in Greek legend. In his time (according to Larcher, about 1759 B.C.) a great flood took place, called the Ogygian flood, which desolated all the lower districts of both countries, and destroyed their inhabitants. The different legends lead to the supposition that under Ogyges an Egyptian colony came to Bœotia, and thence to Attica. From him Bœotia took the name of Ogygia.

OGY'GIA, a genus of trilobites peculiar to the Llandeilo flags of the lower Silurian period. Six species have been described.

O'HARA, JAMES E. See page 894.

OHIO, one of the United States, lies between lat. 38° 17′ to 41° 54′ n., and long. 80° 34′ to 84° 40′ w.; 225 m. in extent from e. to w., and nearly 200 m. from n. to s.; containing 39,964 sq.m., or 25,576,960 acres; bounded n. by Michigan and lake Erie, e. by Pennsylvania and Virginia, from which it is separated by the Ohio river, which also forms its southern boundary, separating it from Virginia and Kentucky, and w. by Indiana. The Ohio river forms its boundary for 436 m., and its lake shore is 230 miles. The high table-lands hilly, and in parts mountainous regions of Ohio, are drained by numerous rivers, among which are the Great and Little Miami, Sciota, and Muskingum, affluents of the Ohio; and the Maumee, Sandusky, Huron, Vermillion, Cuyahoga, and Ashtabula, which empty into lake Erie. Drift formations prevail in the n., alluvium in the s., with extensive coal-measures, and limestone strata, shales, marls, and gypsum, giving the whole state a wonderful fertility. The coal-beds of eastern Ohio cover 10,000 sq.m., with abundant deposits of iron ore. In the n. are valuable deposits of buhrstone, a fossiliferous flinty quartz, used for millstones. The salt produced in 1873 was reported at 4,154,187 bushels. Oil wells have also been opened, and 1,315,660 barrels of oil were refined in the state in 1873. The soil, rich everywhere, is so fertile in the river bottoms as to have borne heavy cereal crops 50 successive years without manuring; the climate is temperate, with a liability to a cold in winter reaching sometimes to 20° below zero. It is healthy, except lowlands liable to fever and ague. The forests are rich in oak, black walnut, maple, etc.; the chief agricultural productions are Indian corn, wheat, rye, oats, hay, sorghum, tobacco, hemp, peaches, apples, grapes, cattle, sheep, swine, the latter being one of its chief exports. The chief manufactures are iron, clothing, furniture, spirits, wines, cotton, and woolen. The wine called Catawba, produced upon the southern shore of lake Erie, compares very favorably with the similar wines of the Rhine. Farms occupy 21,712,420 acres, with an average size of 111 acres. A large commerce is carried on by the Ohio river, the lakes, canals, and numerous railways. The state is organized in 88 counties. The chief towns are Cincinnati, Cleveland, Columbus (the capital), Sandusky, Zanesville, etc. In 1874 there were 170 national and 243 private and other banks. The state revenue in the year ending Nov. 15, 1874, amounted to $5,768,789. Among the state institutions are 4 lunatic asylums, asylums for deaf and dumb, blind, idiots, penitentiary, reformatories, etc. In 1870 there were 11,952 establishments for education, including 9 universities, 33 colleges, 11 theological institutions, 10 medical, and 11,458 public schools. The total attendance was 790,795. The state possesses many extensive libraries, and has 395 newspapers. In 1874, 4,374 m. of railway were open for traffic.

Ohio was organized and admitted as a state in 1803. The pop. in 1800 was 45,365; '20, 581,434; '40, 1,519,467; '60, 2,339,599, of whom 111,257 were Germans, 51,562 Irish, 36,000 English and Scotch; '70, 2,675,468.

OHIO (*ante*). *History.*—The cavalier de La Salle is the first white traveler of record on the soil of Ohio. His journey to discover the Ohio river was made in the winter and spring of 1669–70. See OHIO RIVER. No settlement followed that discovery for a hundred years. The whole territory w. of the Alleghanies was claimed alike by the English and the French, and each made it dangerous for the other to form any permanent settlements. The treaty between those powers in 1763 ceded the territory s. of the lakes to England. The English col. Boquet traversed the state with a military expedition against the Indians in 1764. The colony of Virginia claimed the whole n.w. territory ceded by France under grants from the crown. But Connecticut, New York, and other colonies, also claimed an interest in the same country by conflicting grants. Virginia patriotically ceded her claim to the general government in 1787. Connecticut obtained a recognition of her claim in a compromise by which a tract was set off to her on the s. side of lake Erie containing 3,666,921 acres, known as the "Western Reserve" or "New Connecticut." In 1800 Connecticut relinquished her jurisdiction over the domain, but retained the title to the land and sold it through her own agents. Congress assumed jurisdiction over the north-west territory in 1787. In 1786 a company was organized in Boston under the lead of gen. Rufus Putnam, to buy a large tract in Ohio for colonization; but before the colony started they secured a grant of land from congress; other companies secured similar grants; and members of congress were largely interested in them. The lands so granted amounted to 5,000,000 acres, of which gen. Putnam's party, known as "the

Ohio company," were authorized to locate 1,500,000 acres. They selected lands injudiciously near the mouth of the Muskingum river. In April, 1878, a company of New England people, representing some of the most educated and estimable families, were conducted to that locality and founded the town of Marietta, so named in compliment to Marie Antoinette, queen of our French ally. A similar settlement was made at Cincinnati the autumn of the same year; and a few years later migrations from the leading social and industrial society of the eastern states settled in the western reserve. The Indians, however, were not dispossessed of their rights, and were much feared until the victories of gen. Wayne over them in 1794 at Tippecanoe in Indiana, and at Presque isle on the Maumee river. From that time forward emigration surged over the territory. It established a territorial government in 1800; adopted a state constitution, and was admitted into the union as a state in 1802. Chillicothe was the capital, 1800–10; Zanesville from 1810 to 1812; Chillicothe again from 1812 to 1816, when Columbus became, and remains, the seat of government.

North-western Ohio was the theater of some events of the war with England in 1812–15. Col. Croghan made a brilliant defense of a rude fort at Sandusky; gen. Harrison maintained fort Meigs, on the Maumee, against a combined force of British and their Indian allies under Tecumseh; and lieut., afterwards commodore Perry, won a brilliant naval victory at the w. end of lake Erie over a British fleet which came down from Detroit to attack him. From that time to the present the progress of the state in population and towards a high average condition of comfort for all the people has been nobler than any of the more exciting events of war. Yet the people during the war of the rebellion, 1861–65, illustrated how "the peaceful ever are the strong" by sending into the field promptly as they were called, and always thoroughly equipped, 310,000 men; and furnishing a large proportion of the most successful generals. The state has since inherited from Virginia the title of "the mother of presidents."

The following table shows the population of the state from the time it took a territorial government to the present:

Year.	White—Native and Foreign.	Colored.	Irish and British Isles.	German Countries.	All other foreign born.	Total.	Rank among states.
1800.....	45,028	337	.....	.....	.....	45,365	18
1810.....	228,861	1,899	.....	.....	.....	230,760	13
1820.....	576,572	4,723	.....	.....	.....	581,295	5
1830.....	928,329	9,574	.....	.....	.....	937,903	4
1840.....	1,502,122	17,345	.....	.....	.....	1,519,467	3
1850.....	1,750,746	25,279	.....	.....	.....	1,980,329	3
1860.....	2,011,262	36,673	116,061	168,210	43,983	2,339,511	3
1870.....	2,292,767	62,887	140,028	182,897	49,568	2,665,260	3
1880.....	3,118,344	79,895	143,267	192,597	50,145	3,584,248	3

The cities of Ohio which show a population of upwards of 10,000 by the census of 1880 are: Cincinnati, 255,708; Cleveland, 160,142; Columbus, 51,665; Toledo, 50,143; Dayton, 38,677; Springfield, 20,729; Zanesville, 18,120; Akron, 16,511; Sandusky, 15,838; Youngstown, 15,431; Canton, 12,258; Hamilton, 12,122; Steubenville, 12,093; Portsmouth, 11,314; Chillicothe, 10,938.

The population of the counties of the state by the census of 1880 is, as far as received:

Counties.	Population.	Counties.	Population.
Adams	24,004	Mercer	21,808
Allen	31,323	Monroe	26,497
Ashtabula	37,139	Montgomery	78,545
Athens	28,413	Morgan	20,074

Topography.—Lake Erie on the n. is 580 ft. above the level of the sea. The Ohio river, which forms the entire s.e. and s. boundary of the state, descends from an elevation of a little less than 1000 ft. where it leaves Pennsylvania and strikes the e. line of Ohio, and falls 600 ft. in the 436 m. of its course around the state to the Indiana line. The drainage divide of the state is about one-third of the distance from the n. to the s., so that about one-third of the state drains into the lake and two-thirds into the Ohio river. The summit level or dividing ridge runs from Trumbull co. in the n.e. to Mercer and Darke counties in the s.w., with an average altitude of less than 600 ft. above the lake. The state has, therefore, a general plane of descent from the n.e. to s.w.; he except tion being the n.w. counties which rise on a gentle plane of ascent w. from the lake, into which they drain, through the Maumee river. The state has no mountains. Its greatest local elevation is in Logan co. near the middle of the western half of the state, 1540 ft. above the sea. The hilly or rolling surface of a large part of the Ohio river water-shed and the rounded bluffs that margin the large rivers are the remains of the great erosions by water of the original geologic plateaus. The Ohio river has worn its bed in many parts from 500 to 600 ft. below the hilly summits along its valley, and its tributaries have worn similar though less deep valleys. The main streams flowing into lake Erie, beginning at the e., are: the Cuyahoga river, emptying at Cleveland and forming its harbor; the Black river, 30 m. w.; the Vermillion, 12 m. farther; the Huron, 12 m. from it; the Sandusky, emptying into Sandusky bay; the Ottawa, emptying at Port Clinton; and the Maumee into Maumee bay. All of them have harbors at their mouths. Of these lake streams the Maumee drains much the largest country. The rivers flowing into the Ohio are the Muskingum, emptying at Marietta; the Hocking; the Sciota, having Portsmouth at its mouth; the Little Miami, emptying 6 m. above Cincinnati; and the Miami proper, or Big Miami, joining the Ohio about 20 m. below Cincinnati. All these river valleys are beautiful and fertile throughout; but growing richer in soil relatively from the e. westwardly; the two Miamis being the richest valleys on the Ohio slope; and the Maumee, the Portage, and the Sandusky, the streams flowing through the richest soils to the lake. Toledo, Sandusky, and Cleveland are the main lake ports. The low divide between the Cuyahoga and the Muskingum rivers early suggested the Ohio canal from Cleveland to Marietta. The still lower divide between the estuary of the Maumee and the Miami river led to the construction of the Miami and Erie canal, 247 m. long, from Toledo to Cincinnati, finished in 1839. The Ohio river, notwithstanding an average descent of $\frac{71}{100}$ ft. to the m., is navigable its entire distance along the state for steamers of considerable size at high stages of the water, and for barges at all stages. See Ohio River. The lake shores indicate either a subsidence of the waters or a lifting of the land, as there are several old beaches or ridges that mark old water lines of the lake, now respectively from 100 to 250 ft. above its present level.

Geology.—The geological structure of the state is simple and varies little from the horizontal. Its surface is an erosion of the paleozoic system. There is no show of granite at the surface in the state. The carboniferous, Devonian, and Silurian systems form the surface-rock geology of the state. The quaternary or drift deposits cover a large part of the state, the lowest or first of these being the unstratified blue clay known as bowlder clay; the later deposit a laminate clay called by geologists the Erie clay; and above that vegetable deposits of varied character. The formation of the quaternary deposits is believed to have been going on during remote periods, during which not only alterations of the surface of prior formations were going on by elevation and subsidence, but the climate was varying radically at different periods, the region being at one time under glacial action, and at another under a climate warmer than now. The bowlder blue clay is the deposit of the glacial period. The carboniferous system embraces about one-third of the state, beginning near Portsmouth on the Ohio river for its easterly line of outcrop, and taking a n.n.e. direction to near lake Erie; overlying the Devonian system which geologically forms the surface of the n.e. and n.w. portions of the state. The Cuyahoga shales, Berea grit, and other Ohio sandstones, from near the lake, belong to the Waverly or lowest group of the Devonian stratification. Limestone and conglomerate formations are shown in the outcrops of the w. parts of the state. The whole of the s.c. half is underlaid with the coal-bearing formations; and the geological surveys show seven distinct veins of coal of superior quality for domestic use or for making gas and smelting iron The aggregate thickness of the coal beds which are convenient to work upon is about 50 feet. The outcrop of the coal is along the margins of an irregular belt reaching from Mahoning co. in the n.e. to the Ohio river in the s.; the two extremities of the belt being the most prolific in coal easily quarried, and the beds in the Hocking river valley being considered the great vein coal region of Ohio. The e. outcrop of the coal basin is seen along the Ohio river for hundreds of miles, where tunnels on the coal veins are run directly into the hills from the river slope. The most marked feature in the basic geology of Ohio is what prof. J. S. Newbery terms the Cincinnati arch, which he describes as "a great fold of the strata raised at the close of the lower Silurian age, when it formed two islands, one in Tennessee, the other in Kentucky and Ohio, around which the more recent rocks were deposited on a sloping shore. . . . In the coal-measure epoch, the Cincinnati arch was apparently a land area throughout its entire length, its northern end being then as now its highest portion, and connected with the highlands of

Canada," as shown "by the manner in which the coal-measure strata terminate on the western margin of the basin in Knox and Richland counties, where the coal-beds abut against pre-existent Waverly sandstone hills." The sandstones w. of Cleveland, n.w. of the coal belt, form a great export of Ohio, and are used in all the cities of the northern states and Canada for elegant buildings; also for grindstones.

Minerals.—Besides the coal fields already alluded to under the head of geology, iron ore of good quality has been found over an area embracing nearly one-third of the state, mostly in the e. and s. portion, along the s.e. margin of the great coal belt. Blackband ore is found in n.e. Ohio, and extensively used in the iron establishments of Cleveland, Massillon, Dover, and Port Washington, where they are mixed with other ores. The amount of iron ore mined exceeds 600,000 tons. Salt is made in considerable quantities from salt-springs, the product in 1873 being 1,400,000 barrels. Petroleum has been raised from oil wells in the eastern part of the state to the amount of 1,500,000 galls. a year. Lime for building purposes, both quick and hydraulic, is an extensive manufacture, and largely exported.

Climate.—Like all the northern United States Ohio has a wide range of temperature, running from a tropical heat during a short summer term to an Arctic cold occasionally in winter. The difference between the n. and s. parts of the state is what would be expected from the difference of latitude and a slight difference in elevation; the n.e. part of the state, which is the highest in latitude and altitude, being the coldest in winter and summer; and the s.w., at Cincinnati, proportionally warmer. The shores of lake Erie are noted for their cooling breezes in July and August; receiving a land breeze in the morning, and a lake breeze in the afternoon. In spring, however, they are visited by winds blowing over ice fields floating down from the upper lakes, which chill the air in April and May, when the interior of the state has the most genial temperature.

Below is given the ranges of temperature at representative points in the state: Cleveland and Toledo being on or near the lake, Portsmouth and Cincinnati the s. points on the Ohio river, and Massillon representing the interior, on the divide s. of Cleveland. The latitude of each is given:

Temperature, mean, and of each season, and rainfall.	Cleveland. 41° 30′	Toledo. 41° 40′	Massillon. 40° 70′	Portsmouth. 38° 45′	Cincinnati. 39° 06′

All portions of the state are healthful at present, though there was scarcely a part where malarious diseases were not prevalent in the settlement of the country, and particularly in the valleys of the streams flowing into the Ohio and the w. end of lake Erie, where those ailments are now extremely rare.

Productions.—There is probably no state of the union with less waste land than Ohio. The broken hills of the s.e., particularly noted for their products of coal and iron, are the least, and the central and w. the most, fertile. Every production of the temperate zone may be cultivated in some portion of the state, and every species of domestic animal is as profitable there as elsewhere. More than a fifth of the entire wool crop of the United States was produced in this state in 1870; nearly two-thirds of the flax; and of milk, butter, and cheese, only the state of New York produces more, or exceeds Ohio in the value of its farms per acre. The n.e. part of the state, known as the Western Reserve, or New Connecticut, is the most noted dairy region; the lake borders the most valued for fruit, especially grapes; the southern part for stock; and the w. and s.w. for corn; yet all portions grow pretty nearly the same crops, with a slight difference of adaptability.

*Exclusive of Spring lambs.

The total value of farms in the state in 1880 was $1,127,497,353; of farming implements and machinery, $30,521,180; of all farm products, $156,777,152. The average product per acre in 1883 was: of wheat, 10 bush.; corn, 26.1 bush.: oats, 33.9 bush.; rye, 9 bush.; barley, 16 bush.; potatoes, 99 bush.; hay, 1.40 tons; tobacco, 932 lbs.

The fisheries of the state produce an important element of its commerce. Those conducted on a considerable scale are at the w. end of lake Erie, between the islands and the main-land for white-fish, and in the Sandusky and Maumee bays and their tributaries for pickerel, bass, mullett, cat-fish, and muskallonge. The annual out-put from the fisheries of the lake and its rivers exceeds $1,500,000 of value. They are packed principally at Toledo and Sandusky for export, and are consumed in the interior.

Manufactures.—In 1880 Ohio ranked fifth among the states in the capital employed in manufacturing and in the value of manufactured products; second to Michigan in the value of woodenware, and first in the making of agricultural implements. In iron works Ohio ranked next to Pennsylvania. The number of establishments that year was 20,699, employing upwards of 183,609 hands, of whom 152,217 were men, 18,563 women, and 12,829 boys and girls under 15 years of age. They used 6,215 steam engines, aggregating 222,502 horse-power, and 2,080 water-wheels, of 38,641 horse-power. The capital engaged was $188,939,614; the wages paid per year, $62,103,800; cost of raw materials, $215,334,256; and value of products, $348,298,390. The great business of all new and flourishing states—the manufacture of houses—does not enter specifically into the list of manufactures, and is not given fully or even approximately under the several heads of figures opposite to carpentering and building, brick, lumber, etc. The following table shows, otherwise, the main manufacturing interests of the state in 1880:

PRINCIPAL MECHANICAL AND MANUFACTURING INDUSTRIES OF OHIO CONDENSED FROM THE CENSUS OF 1880.

The coal fields cover an estimated area of 12,000 sq.m., extending through twenty counties, and embracing nearly one-third of the total area of the state. During 1882 the quantity of stove coal mined was 148,903,635 bush., valued at $6,998,632 ; and in 1883 the entire output of coal was 8,225,000 tons. Iron is found in abundance in certain parts of the state, particularly in Perry, Gallia, Licking, Lawrence, Jackson, Vinton, Meigs, Athens, and Hocking cos. Some of the ore is of superior quality and adapted to the finer class of castings. In 1882, 568,644 tons of iron were mined ; and in 1883, 679,643 tons of pig-iron were produced. Petroleum is found in the s.e. portion ; 1,161,303 galls. were produced, 1882. The refinement of the oil is one of the growing industries of the state. Clay in all its forms is found in large quantities ; carbonate of lime, quick-lime and water-cement are very extensively manufactured. Building stones and grindstones in great quantities are quarried in the northern part of the state. Pork and other meat-packing has become, by the appliances of machinery to the work, one of the manufactures of the country. Ohio formerly outranked all the other states in the packing

business, but is now second to Illinois. The records of the packing season of 1880 for Ohio show 1,434,179 hogs cut up, of 246 lbs. average weight. The lard product was 48,985,283 lbs. Total value of the hogs slaughtered, $13,484,758. Bacon and hams, 74,507,202 lbs. See CINCINNATI.

Commerce.—Ohio has three U. S. customs districts, of which the ports of entry are Toledo, Sandusky, and Cleveland, and Cincinnati is a port of entry in the district of Louisiana for the state of Ohio. These customs ports represent only the foreign imports and exports, which the position of Ohio on the lakes, adjoining Canada, and in communication with ocean commerce through the Canadian canals and the St. Lawrence, enables her merchants to make direct to and from foreign countries. The same may be said of Cincinnati, though its foreign trade must be done much more indirectly through the Ohio and Mississippi rivers. The foreign commerce of Ohio is, however, insignificant compared with the vast domestic commerce e., w., n., and s., along her lakes, railways, canals, and great river. Lake Erie is still the greatest single highway of commerce for the state.

Formerly the canals were expected to be second only to the lake and the Ohio river in volume of commerce, but the railways have far surpassed them in carrying facilities, so that the great value of the former is now to secure low rates on the railways by their always cheaper, though slower, transportation. There are 690 m. of canal in the state, including 36 m. of feeders and side cuts, besides 95 m. of slack-water navigation on the Muskingum river from Marietta to Dresden. The Ohio canal, between Cleveland and Portsmouth on the Ohio, and with its 22 m. of feeders, is 331 m. long. The Miami and Erie canal, from Toledo to Cincinnati, is 246 m. long, with—

Wabash feeder to Indiana state line	18 miles.
Sidney feeder	14 "
St. Mary's reservoir	11 "
Walhonding to Rochester	25 "
Hocking, Carroll to Athens	56 "
Total	360 miles.

The "Wabash feeder," as it is listed above, is really the main line of the Wabash canal, extending from Toledo s.w. into Indiana, a distance of 422 miles. The Miami and Erie being the first chartered, the Wabash merges its name from the junction down to Toledo. The Wabash canal, when it was finished in 1844, was the longest continuous canal in the world. The business still transacted on all these canals is very great. On the Ohio canal it has become principally of coal, iron ore, and bulky farm products; on the Wabash and Miami and Erie canals, it is principally in corn, wheat, provisions, and lumber, with a large business also in heavy merchandise, coal, iron, ice, etc.

Railroads.—About 88 different lines of railway form a net-work in every direction through the state, making about 7,737 m. in length, without counting double or more than double tracks. The following table gives the names of all the railway companies doing business in Ohio, many of them wholly in the state, and others parts of long lines which traverse the state mostly from e. to w.; also, the assessed values upon which such roads so lying within the state were taxed in 1884:

NAMES OF RAILROADS AND CORPORATIONS.	No. of Miles in state.	Cost per Mile.

Total valuation of all railways in the state in 1883, $765,983,258. The capital stock of these roads, in 1884, was $382,448,654; total investment, $765,983,258; the earnings from passengers, $16,326,910. More than half the roads are supplied with steel rails.

Education.—The total expenditures for school purposes in Ohio are about $10,000,000. One mill on the dollar constitutes the state tax for the educational fund. The number of school-houses in 1882 was about 12,264 ; enrolled pupils, 751,101 ; teachers employed, 24,135 ; average monthly wages of men teachers, $39 ; women, $29. Total value of public school-houses and grounds, $23,610,858. Education is compulsory, but the law is not strictly enforced. There are public normal schools at Cincinnati, Cleveland, Dayton, Columbus, and Steubenville, and 7 private schools. Two educational journals are published. Among the 34 collegiate institutions, are the University of Cincinnati, Ohio University at Athens, and the colleges of Hiram, Marietta, Oberlin, Kenyon (Gambier), and Wittenberg (Springfield). Nearly all the universities and colleges have scientific departments. The state university and agricultural and mechanical college at Columbus was founded in 1870, with a state endowment of $700,000 ; has buildings and grounds that cost $300,000 : an income of $30,000 from its endowment ; and is, in these respects, the strongest based institution in the state. There are 4 theological seminaries, 1 law school, 11 schools of medicine, pharmacy, surgery, and dentistry ; 5 schools of design.

Libraries.—In 1853 a general school law was passed to raise a fund by a tax of one-tenth of a mill on the dollar yearly "for the purpose of furnishing school libraries and apparatus to all the common schools of the state." Within three years thereafter 332,579 volumes were placed in the school libraries. The law was suspended in 1857–58, and the libraries were suffered to go down by negligence. In 1860 the law was re-enacted, and in 1865 350,000 volumes were in the common school libraries. But the system was too attenuated. The small and poor districts had not sufficient funds to maintain continuous care of a library, so that books became scattered and lost almost as fast as fresh purchases were made. The small local school libraries have since been turned over to town library associations under a general law passed in 1867. A law of Feb., 1868, authorized the city councils of any city of the second class to levy a tax, not exceeding one-half of a mill on the dollar, "for a free public library and reading-room, providing suitable accommodations are furnished without expense to the city." Under the action of this benign law noble public libraries are maintained in every large city, and smaller ones of great value in all small towns; and a local pride and public spirit is stimulated to promote their growth by private donations of every kind, to render them more creditable to the town which supports them. The free public library of Cincinnati is probably the largest library ever created from a public fund derived from annual taxation. The library building was begun in 1868, partially occupied with about 31,000 volumes in 1870, and finished and dedicated Feb., 1874. It was at that time the finest library building in America, having a shelf capacity of 250,000 volumes. It opened with 70,000 volumes, and by June 30, 1880, by purchase and donations, the number had swelled to about 121,651 volumes. The number of readers in attendance on Sundays then averaged 1000. The annual income at the same time was $20,000, and increasing with the growth of the city. The creation of this public library at Cincinnati is a sample of the ambitious and successful development of smaller public libraries all over the state. This is exclusive of college and corporate society libraries of every kind.

Publications.—In 1880 the newspapers and periodicals of the state numbered 774, of which 56 were dailies, 8 tri-weeklies, 4 semi-weeklies, 584 weeklies, 3 bi-weeklies, 18 semi-monthlies, 90 monthlies, and 11 quarterlies. The dailies have a circulation in and out of the state of about 216,336 copies daily ; the weeklies of 2,877,595 per week. In Cincinnati there are great publishing houses, not of periodicals only, but of standard and light literature and of school-books. Cleveland, Toledo, and Columbus also have considerable publishing houses.

Religious Organizations.—In 1875 there were 8,120 religious societies of all denominations; 6,830 religious edifices; 5,391 ministers and priests; 513,566 members or communicants; and $33,328,000 value of church property. The Methodist denomination is strongest in numbers and value of property; the Roman Catholic next; and the Presbyterians third. Twenty-three names of Christian denominations appear on the census books, ranging in the number of their organizations from 2 to 2,572.

Public Charities.—These consist of the Athens asylum for the insane, maintained at an annual cost of about $120,000; the Cleveland asylum, about $100,000; the Columbus asylum, about $190,000; Dayton asylum, from $90,000 to $100,000; Lucas county asylum, $25,000; Longview, for colored insane, $2,000; the deaf and dumb asylum at Columbus, from $75,000 to $80,000; the blind asylum, from $40,000 to $50,000; the asylum for imbeciles, from $75,000 to $90,000; the soldiers' and sailors' orphans' home, from $75,000 to $100,000; the girls' industrial home, from $40,000 to $50,000: the reform farm school, $60,000 to $70,000; and the Toledo house of refuge, $20,000 to $30,000 The state penitentiary at Columbus is maintained at an expense of about $200,000 a year, against which is credited the receipts from convict labor, which in 1881 were $190,614. The inmates are employed in various trades and their work is let out to contractors. Faithful and good work is credited to the convict at the rate of five days less on the time of his sentence for each month of such labor, and a proportion, not to exceed one-tenth, of his earnings. If he passes his whole term of imprisonment without violating prison rules, he will be restored to citizenship. All the charitable institutions named are maintained out of state funds; but a still wider range of charities is maintained in the cities of the state by societies incorporated under general laws and carried on by contributions of voluntary workers.

Finances.—The auditor's report for 1883 shows:

Total receipts, including balances of preceding years	$5,868,590
Disbursements for the year 1879	5,083,115
Cash balance in treasury, Nov. 15, 1883	$785,474

The above balance is to the credit of the following funds:

General revenue fund	$413,356	
Sinking fund	208,892	
Common school fund	17,927	
		$640,176

The total public debt of Ohio, 1883, Nov. 15, was $4,522,515, due as follows:

Payable after 1886, Dec. 31, bearing 6 per cent interest	$2,345,850
" " 1884, July 1, " 4 " "	350,000
" " 1885, " " " "	350,000
" " 1886, " " " "	375,000
" " 1887, " " " "	500,000
" " 1888, " " " "	600,000
Canal loan, not bearing interest	1,665
Total state funded debt	$4,522,515

Statement of the receipts, disbursements, and balances of each of the foregoing funds:

Funds.	Balances in Treasury, Nov. 15, 1882.	Receipts during Fiscal year.	Total receipts including balances.	Disbursements during Fiscal year.	Balances in Treasury, Nov. 15, 1883.
General Revenue Fund	$413.356.29	$2,768,750.98	$3,182,107.27	$2,563,231.27	$618,876.00
Sinking Fund	208,892.70	850,574.93	1,059,467.63	897,903.17	161,564.46
State Common School Fund	17,927.94	1,609,087.87	1,627,015.81	1,621,981.50	5,034.31
Totals	$640,176.93	$5,228,413.78	$5,868,590.71	$5,083,115.94	$785,474.77

The total county debts of the state in 1883 were	$4,381,680
" " debts of cities of the first and second class	35,231,302
" " " of villages, townships, and school special districts	3,775,112
Total local debts	$43,388,095

By the bulletins of the U. S. census returns of 1880, showing the outstanding bonded indebtedness of cities and towns containing a population of 7,500 or upwards, it appears that Ohio towns and cities stand below the average of all the states in their city debts per capita, and above the average of the cities of the western states.

City debts in an average of all the states	$58.53	per capita.
" " average in north-eastern states	62.15	" "
" " " " middle Atlantic states	76.51	" "
" " " " southern states	55.86	" "
" " " " western states (Ohio included)	32.28	" "
" " of the state of Ohio	50.36	" "

It also appears by the same table that New England pays the lowest interest on its city debts, the middle Atlantic states next, the southern states third, and the western states the highest.

Banks.—There were in Ohio, Sept. 30, 1884, 184 national banks in operation (excluding 12 in Cincinnati and 8 in Cleveland), with a paid in capital of $22,039,000, and an outstanding circulation of $4,266,220. There were in 1882, 31 state banks and trust companies in all, with an aggregate capital of $2,675,633; 231 private banks, with capi-

tal of $4,860,941; 6 savings banks had a capital of $235,000, while Cincinnati and Cleveland had one bank each with no capital.

Temperance Legislation.—The legislature, Apr. 1883, passed a high license liquor law; in Dec., the liquor dealers declared it unconstitutional, and petitioned for its modification; this was opposed by the women's temperance association, which asked that a prohibitory amendment to the constitution be submitted to the people; feeling ran high, and, in 1884, the legislature repealed the local option feature.

Government—The constitution of 1851, with some amendments, and the laws passed under it, are now codified and published. The conditions of suffrage are to be a male, 21 years of age, native or naturalized, to be a resident one year in the state, 30 days in the county, and 20 days in the township, village, or ward, preceding the election where the vote is offered. The second Tuesday in October is the day of general elections. The legislature consists of a senate of 33 members, and a house of representatives of 105 members, elected for two years. The sessions are biennial, beginning the first Monday in January in even years. The governor has a salary of $4,000; lieutenant-governor, $800; secretary of state, $3,000; auditor, $3,000; treasurer, $3,000; comptroller of the treasury, $2,000; attorney-general, $1500 and fees; and commissioner of schools, $2,000. Their term is two years, except the auditor's, which is four years, and the comptroller and school commissioner, who have three-year terms. The board of public works consists of three members, elected one at each general election for two years. The commissioner of railroads and telegraphs, superintendent of insurance, supervisor of public printing, gas commissioner, and state and law librarians, are appointed by the governor. The state board of agriculture consists of 10 members, five of whom are chosen annually for two years at a convention composed of the presidents of the county agricultural societies. Under the apportionment of 1880 the state was entitled to 21 members of congress.

Judiciary.—The judicial power of the state is vested in a supreme court, in district courts, courts of common pleas, courts of probate, justices of the peace, and such other courts inferior to the supreme court as the general assembly may from time to time establish. The supreme court consists of five judges, a majority of whom are necessary to form a quorum or to pronounce a decision. It has jurisdiction in *quo warranto*, *mandamus*, *habeas corpus*, and *procedendo*, and such appellate jurisdiction as may be provided by law. It must hold at least one term a year at the capital, and elsewhere as may be required by law. Supreme judges are elected for five years at general elections, one each year, and the judge having the shortest time to serve is the chief-justice for the year. The state is divided into nine common pleas districts, bounded by county lines. Hamilton county constitutes one district. Each district consisting of three or more counties is sub-divided into three sub-districts, in each of which one judge is elected for two years by the voters or that sub-division. Courts must be held at least once a year in every county in the district, and two or more judges may hold court in a county at the same time, taking cases alternately on the docket in their order. District courts are composed of the judges of the court of common pleas of a district, and one judge of the supreme court, who, with two of the former, constitute a quorum, and have the same original jurisdiction as the supreme court and such appellate jurisdiction as may be fixed by statute. A probate judge is elected for three years by each county. The probate court has jurisdiction in probate and testamentary matters, the appointment of administrators and guardians, the settlement of their accounts and those of executors, and the power to limit and authorize their action. It is empowered also to try municipal cases involving the awards of damages for the condemnation of private property for public use; is a court of record, and has the issuing and record of marriage licenses. Vacancies of judges are filled by the governor for an unexpired term. The legislature has power to increase or diminish the number of judges, alter districts, and establish other courts. Judges may be removed by a concurrent resolution of both houses of the legislature, if two-thirds of all the members concur. Justices of the peace are elected in every township for three years.

The following is the list of governors:

GOVERNORS.		GOVERNORS.	
1. Arthur St. Clair, territorial	1788–1802	19. Thomas W. Bartley (acting)	1844–1844
2. Charles W. Byrd, territorial	1802–1803	20. Mordecai Bartley	1844–1846
3. Edward Tiffin, state	1803–1807	21. William Bebb	1846–1849
4. Thomas Kirker (acting)	1807–1808	22. Seabury Ford	1849–1850
5. Samuel Huntington	1808–1810	23. Reuben Wood	1850–1853
6. Return J. Meigs	1810–1814	24. William Medill (acting)	1853–1854
7. Othniel Looker (acting)	1814–1814	25. Salmon P. Chase	1856–1860
8. Thomas Worthington	1814–1818	26. William Dennison	1860–1862
9. Ethan Allen Brown	1818–1822	27. David Tod	1862–1864
10. Allen Trimble (acting)	1822–1822	28. John Brough	1864–1865
11. Jeremiah Morrow	1822–1826	29. Charles Anderson (acting)	1865–1866
12. Allen Trimble	1826–1830	30. Jacob Dolson Cox	1866–1868
13. Duncan McArthur	1830–1832	31. Rutherford B. Hayes	1868–1872
14. Robert Lucas	1832–1836	32. Edward F. Noyes	1872–1874
15. Joseph Vance	1836–1838	33. William Allen	1874–1876
16. Wilson Shannon	1838–1840	34. Rutherford B. Hayes	1876–1878
17. Thomas Corwin	1840–1842	35. William H. Bishop	1878–1880
18. Wilson Shannon	1842–1844	36. Charles Foster	1880–1882

Charles Foster, 1882–1884; George Hoadly, 1884–1886.

Ohio in 1885 has 21 congressional districts and representatives in congress.

OHIO, a co. in s.e. Indiana, adjoining Kentucky; bounded on the e. by the Ohio, on the n.w. by Langhery creek; 100 sq.m.; pop. '80, 5,563—5,239 of American birth. The surface is uneven and hilly, and the soil fertile. The principal productions are corn, wheat, barley, oats, and potatoes. Co. seat, Rising Sun.

OHIO, a co. in w. Kentucky, bounded on the s.w. by Green river, watered by Rough creek: on the Paducah and Elizabethtown railroad; 730 sq.m.; pop. '80, 19,669—1464 colored. The surface is rolling and well-wooded, and contains coal and iron. The soil is fertile, and the principal productions are corn, tobacco, wheat, potatoes, wool, and hay. Co. seat, Hartford.

OHIO, a co. in n.w. West Virginia, adjoining Pennsylvania, bounded on the w. by the Ohio, intersected by Wheeling creek; on the Baltimore and Ohio railroad; 100 sq.m.; pop. '80, 37,457—856 colored. The surface is uneven and hilly, and contains deposits of bituminous coal. The soil is fertile, and produces good crops of corn, wheat, hay, and oats. There are many iron manufactories. Co. seat, Wheeling.

OHIO RIVER, a river of the United States of America, called by the French explorers after its Indian name, *La Belle Rivière*, next to the Missouri the largest affluent of the Mississippi, is formed by the union of the Alleghany and Monongahela, at the western foot of the Alleghanies, at Pittsburg, in Pennsylvania, and flows w.s.w. 975 m., with a breadth of 1200 to 3,000 ft., draining, with its tributaries, an area of 214,000 sq. miles. In its course it separates the northern states of Ohio, Indiana, and Illinois, from the southern states of Virginia and Kentucky. The principal towns upon its banks are Cincinnati Louisville (where there are rapids of 22 ft. in a m., with a steam-boat canal), Wheeling, Maysville, Pittsburg, and Cairo. It is usually navigable from Pittsburg, but for larger steamers in summer only from Wheeling. The banks of the Ohio are generally high and terraced. It is often shallow, is sometimes frozen, and is subject to floods of 50 or 60 ft. above low-water. Bordered by a rich country, and great deposits of coal and iron, it is the channel of a vast commerce, which it shares with its chief branches, the Tennessee, Cumberland, Wabash, Green, etc.

OHIO RIVER (*ante*). It is probably incorrect to name the Ohio river as the largest affluent of the Mississippi next to the Missouri, as the Arkansas river lays claim to that position both by its length and the volume of its waters. The distance from where the

Ohio begins by the confluence of the Alleghany and Monongahela at Pittsburg to its mouth is 975 m.; but the entire length of the river should include the whole length of the Alleghany, the longest of its river sources, which is not less than 300 m. more. The river was discovered by the cavalier de la Salle in the fall and winter of 1669–70. He had for several years before been gathering information concerning it from the Iroquois who visited his seignory at La Chine above Montreal, and finally reached its source by the way of Niagara and up Cattaraugus creek; from which his Indian guide is supposed to have led him to French creek, one of the w. sources of the Alleghany, and only 14 m. from lake Erie. It is supposed that his canoes were carried from Cattaraugus creek over to French creek, though it is possible that the portage may have been made from the upper waters of the Genesee river. With canoes launched in autumn on the stream of the Alleghany the discovery of the Ohio followed naturally, and was arrested only by the falls where Louisville now stands. There La Salle turned back, still undecided whether the stream emptied into the gulf of Mexico or into the Pacific ocean, but inclining to the latter opinion. It must have been from the time of this voyage that the river acquired the title of *La belle rivière*—the beautiful river, which it was subsequently called by the French. The source of the Alleghany is in the center of Potter co., Penn., the middle of the n. tier of counties, where the table-lands receive the rainfalls which hesitate which way to flow—whether to join the waters of the St. Lawrence, or to seek the valley that leads them to the gulf of Mexico. See ALLEGHANY RIVER. The junction of the Monongahela at Pittsburg forms the Ohio. These rivers, rising one n. and the other s. in the Alleghany range, meet in the heart of wooded hills like those through which they have flowed, and the Ohio for 500 m. of its course below, plows its way through a valley deepening and widening as it goes till the rounded hills along this part merge into the rolling prairies of southern Indiana and Illinois, and disappear in the lowlands below the junction of the Wabash. Its entire valley has been eroded by the action of the water, and though everywhere beautiful in a state of nature, is nowhere picturesque or wild. The geologic formations along its entire line are nearly level and little disturbed by any violent convulsion. The area of its drainage is 214,000 sq. m.; embracing a small part of the state of N. Y., one-third of Pennsylvania, two-thirds of Ohio, all of West Virginia, Kentucky, and Tennessee, small portions of North Carolina, Georgia, Alabama, and Mississippi, two-thirds of Indiana, and the s.e. part of Illinois. In this area are included the great valleys of the Tennessee and Cumberland rivers, which join the Ohio only near its mouth. The shores through much of the upper half of the river present a series of plateaus and broken bluffs that indicate successive wearings below the plane of its former flow, and exhibit a broad valley from 5 to 10 m. in width between its bounding hills. The immediate shores at ordinary stages of the water are cut through alluvium generally, with the marks of recent wearing of water and caving of banks. From Pittsburg to Portsmouth the adjacent hills are mined for coal or iron in many places, and the loading of both into barges in the river is done to an unusual extent by those who own both mines and boats and market their own productions. The s.e. part of Ohio as well as w. of Pennsylvania is a landscape spotted with the smoke of furnaces for the manufacture of iron. Among the abrupt hills below Pittsburg the river is only 1000 ft. wide at low water, and 1200 at high water. It widens gradually below and its high stages frequently cover a vast extent of bottom lands. The range between its high and low stages of water is very great, 60 ft. being the greatest difference, and 45 ft. the mean difference. The navigation below Louisville is good for large steamers at all seasons, and is usually maintained for most of the summer up to Wheeling, and in good stages of water up to Pittsburg; but is often too low in summer to permit the "down river boats" to make their trips up to Cincinnati. For rafting and for coal and iron barges it is good at all seasons. At Louisville are the only rapids. These fall 27 ft. in 2½ m., and are passed by means of a ship canal with locks for the largest river steamers, and affording an abundant water-power. The immense passenger travel formerly by river steamers has largely been transferred to the railways. The rate of the current varies from one to three m. an hour, depending on the volume. The rivers which flow to the Ohio from the n. are the Alleghany, Muskingum, Hocking, Sciota, Big and Little Miamis, and the Wabash; from the s. the Monongahela, Little Kanawha, Great Kanawha, Sandy, Licking, Kentucky, Green, Cumberland, and Tennessee. The principal cities and towns upon its banks are Pittsburg, Wheeling, Elizabethtown, Marrietta, Parkersburg, Pomeroy, Gallipolis, Ironton, Portsmouth, Cincinnati, Covington, Newport, Laurenceburg, Madison, Louisville, New Albany, Leavenworth, Evansville, Paducah, and Cairo at its mouth where it joins the Mississippi.

OHIO WESLEYAN UNIVERSITY, at Delaware, Delaware co., Ohio, was founded in 1844, under the auspices of the Methodist church in Ohio. In 1877 the Ohio Wesleyan female college, founded in 1853, was united with the university. Its building is now known as the Monnett hall of the university, and is the home of the lady pupils. The productive endowment is over $250,000, the annual income $32,000. The grounds used for academic purposes lie in the lots, about half a mile apart. One is the original campus of the university, containing twenty-five acres, and having on it four large buildings. The other is the campus of the Monnett hall, containing ten acres, and having on it one very large building. The cabinet rooms are ample and admirably arranged. The collection contains about 100,000 specimens. In the departments of conchology

and Ohio geology the series are quite complete. The philosophic and chemical apparatus is not so extensive, but sufficient for all academic work, and the laboratories are well equipped. There are two college libraries, aggregating 25,000 volumes, and a reading-room open and free to all the pupils. The number of professors in 1885 was 11, besides one vacancy, and there were 12 other regular instructors. The faculty of arts is very thoroughly organized, and there are an important biblical course, and a full scientific course. There is also a department for fine arts for ladies. The number of students in the catalogue for 1884 was 791, of whom 280 were ladies. Ladies are admitted to all the courses of study, classical or scientific; but a special ladies' course is prescribed for those who do not elect one or the others. There is likewise a normal course for those who would fit themselves for teaching. A preparatory department is maintained with a three years' course of study, and most of the college students are here prepared. The college classes number 310, the normal class 31, the preparatory 373. The academic department includes a commercial course. President, Rev. Charles H. Payne, D.D., L.L.D.

OHLAU, OLAU, or OLAWA, a t. of Prussian Silesia, 17 m. s.e. from Breslau, on the Oder. Ohlau, which is on the railway between Breslau and Vienna, is an ancient town, with a royal palace and an old castle. At the present day, it is a place of considerable industrial activity. Being the capital of a circle, it has numerous district courts and offices. Pop. '80, 8,395.

OHM, unit of resistance. See GALVANISM (OHM'S LAW), *ante.*

OHM, GEORGE SIMON, 1787–1854; b. Germany; educated at Erlangen. After giving mathematical instruction in a number of places, he was called, in 1817, to a chair in the Jesuit college at Cologne, and the next year published an elementary treatise on geometry. He made a study of the laws of galvanic currents and finally discovered the theorem called "Ohm's Law," upon which the mathemetical theory of electricity is founded. An exposition of this theory is contained in *The Galvanic Chain, Mathematically worked out*, 1827. Among his other works are: *Elements of Analytical Geometry*, 1849, and *Principles of Physics*, 1854,. He left his professorship at Cologne in 1826, was director of the Nuremberg polytechnic school 1833–49, and was then called to the chair of physics at Munich

OI'DIUM, an important genus of minute fungi of the section *Hyphomycetes*, growing on diseased animal and vegetable substances. They consist of minute tubular threads, forming flocks, white in some species, brightly colored in others, simple or irregularly branched, assuming in their upper part the form of strings of beads, which finally break up into elliptic spores. The species actually existing are probably much more numerous than those which have been fully ascertained. Among the most important of the vegetable parasites of man is *O. albicans*, which is found on the epithelium in the mouth and throat in the disease called *aphthæ*, or thrush, and on that of the throat in diphtheria, also sometimes in the nostrils, stomach, and intestines, on the nails, the nipples, and other places. It is more common in children and in aged persons, than in those who are in the prime of life. It occurs frequently in the last stages of many diseases, when the mucous membrane is covered with nitrogenous decomposable matter. Indeed, it would seem that whatever may be the case as to other vegetable parasites, no species of Oïdium begins its attack upon a perfectly healthy surface, either animal or vegetable; a diseased state of the tissue being to these fungi a necessary condition of vegetation "just as the yeast-plant will not vegetate save in a fermentable fluid, that is, in a solution which, in addition to sugar, contains some decomposable albuminous matter." *O. albicans* appears to the naked eye as a white pasty substance, slightly elevated above the mucous membrane to which it adheres; but under the microscope, its filamentous structure is easily perceived. Its seat is at first on the upper surface of the epithelial cells, but its filaments soon penetrate deeply between them, and the upper epithelial layers are soon worn out, and thrown off by the rapid growth from below. However incapable the *O. albicans* may be of attacking a healthy surface, there can be no doubt that it greatly contributes to the extension of disease, and that it is very readily communicated from one patient to another when there is catarrh or other inflammatory affection of the mucous membrane.

Another species of oïdium which has attracted great attention is *O. Tuckeri*, regarded by many as producing the grape disease, which, several years ago, injured the vineyards of many parts of the world, but in accordance with the views already expressed, perhaps rather to be regarded as merely accompanying and extending the disease. It may probably be the case that over-cultivation of particular varieties of grape, and too long continued cultivation on the same ground, have so impaired the vigor and healthfulness of the plants as to make them liable to the attacks of this parasite. *O. Tuckeri* makes its appearance at first in the form of a *mycelium* of webby, creeping, branching filaments, which send out upright or decumbent jointed stems. The bead-like joints of the stems become successively filled with spores, which are finally discharged in little clouds for the multiplication of the species. The grape disease was first observed in Kent, England, in the spring of 1845, on vines in the vinery of Mr. Tucker. The ends of the

young shoots assumed a crispy appearance, began to wither, and then dried up. The unripe grapes were next attacked, becoming covered with a grayish-white bloom, the skin of the grapes being destroyed, and they rotted and dried up. The disease rapidly spread over other English vineries; was observed about the same time in the vineries of Paris, and soon in the vineyards of almost all parts of France, Italy, Greece, Tyrol, and Hungary; finally, and in a slighter degree, affecting the vineyards of the Rhine. Its ravages extended to Algeria, Syria, Asia Minor, and many other countries, among which is particularly to be noticed the island of Madeira, where it proved almost completely destructive to the grapes, and nearly put an end to the production of the celebrated Madeira wine. The importation of Madeira wine to Britain in 1831 amounted to 209,127 gallons; and in 1861 only to 28,749 gallons. It is probable that the complete isolation of the Madeira vineyards made the progress of the disease more rapid, and its results more complete than elsewhere, by causing a prevalence of the conditions favorable for it. No kind of vine escaped. The grape disease is first perceived in the leaves, which become whitish, in consequence of a mycelium spreading over the upper surface of the leaf. The leaves sometimes curl up, or they become black at the center, the blackness extending towards the circumference, and finally they drop off. The plant, through loss of its leaves, now becomes more unhealthy; the shoots are attacked by the disease, the stalks of the bunches of grapes, and the grapes themselves. The parasite penetrates into the young wood, the shoots are covered with spots and blotches of a reddish-brown, or even black color, and look as if a red-hot iron had been applied to them. Sometimes they secrete a clammy inodorous fluid all over their surface; and in many cases they wither from the top down half their length. The affected grapes very often first exhibit the disease in a single whitish spot on a single grape of a bunch, which enlarges by radiating irregularly. If in a bunch there is one abortive grape, it often shows signs of the disease, whilst the rest remain free. The creeping branches of the mycelium are fixed upon the skin of the grape by rootlets, which do not penetrate into the juicy pulp. The mycelium sends up vertical fertile branches of nearly equal height, densely aggregated, and forming a velvet-like mass. The extremities of these become beaded; and at last the uppermost cell or bead increases in volume, becomes detached, and is carried off by some slight breath of air, to multiply the species by the dispersion of its spores. The other bead-like cells follow in succession.

Various means were resorted to for the prevention and cure of the grape disease. The application of pulverized sulphur was found useful, the fungus withering and drying up when brought into contact with a minute particle of sulphur. The application of sulphur must be frequent, as portions of the mycelium and some of the spores always escape. The use of sulphur was the chief means of checking the spread of oïdium in French and European vineyards; it became general in the south of France and in Italy; and in consequence of its national importance, the duty on sulphur was reduced by the French government. Hydrosulphide of lime was also applied to vines with very beneficial effect. It is prepared by thoroughly mixing 68 ounces of flowers of sulphur with the same quantity of slaked lime, adding three or four quarts of water, boiling for about ten minutes, allowing it to settle, and decanting the clear liquor. When it is to be used, one quart is mixed with 100 quarts of water, and it is poured over the vines.

OIL-CAKE, the cake which remains in the press when seeds are crushed to express the oil which they contain. Oil-cake still retains a portion of the oil of the seed, along with almost all its other constituents, and is valuable either for feeding cattle or for manure. *Linseed-cake* is so much more largely used in Britain than any other kind that the name oil-cake is in general exclusively appropriated to it, the other kinds being known as *rape-cake*, *poppy-cake*, *hemp-cake*, *colza-cake*, etc., according to the plant from the seed of which they are produced. The use of oil-cake for feeding cattle has very much increased of late years, and it is an article of commercial importance. Large quantities are imported into Britain from different parts of the continent of Europe, and from North America. But *English linseed-cake*—cake made at oil-mills in England, mostly from imported seed—is preferred to any other, because heat not being so freely applied during the expression of the oil, more oil is left in the cake, and also because foreign cake often suffers from dampness both before and during the sea passage. Besides the oil which remains in it, linseed-cake contains from 24 to 33 per cent of nitrogenous substances or protein compounds, which make it very valuable both for feeding cattle and for manure. The value of linseed-cake for feeding is greater than that of any kind of grain or pulse.—*Rape-cake* is, next to linseed-cake, the kind of oil-cake best known in Britain. It is much cheaper than linseed-cake, but is not relished by cattle, having a hot taste, and a tendency to become rancid. Sheep, however, eat it readily, and it is often employed for fattening them. It is often also ground to a coarse powder (*rape-dust*), and used as a manure, Its fertilizing power is great, and it is used by the Flemish farmers as guano now is by those of Britain.—*Cotton seed-cake* is much used as a manure in some parts of North America.—*Cocoa-nut-cake* is used in the south of India, both for feeding cattle and for manure.—Other kinds of cake are noticed, if sufficiently important, under the plants from which they are derived. Their properties are generally similar to those of linseed-cake, although the pungency of some, as *mustard-cake*, renders them unsuitable for feeding cattle. See Oils.

OIL CITY, a borough of Oil Creek township, Venango co., Penn., situated on the Alleghany river, at the mouth of Oil creek, 9 m. from Franklin; pop. 1880, about 7,313; of township, 7,839. The city lies on a narrow stretch between the river and a steep bluff, on which are many of the private residences. It was founded in 1860 and incorporated in 1871. The people are chiefly engaged in refining, barreling, and shipping petroleum. Nearly 2,000,000 barrels are shipped from the oil wells of the vicinity yearly. There are 5 banks, 2 refineries, a daily and weekly paper, an oil exchange, and many churches and schools.

OIL-FUEL. A great incentive has been given by the discovery of copious wells of petroleum (see OIL-WELLS AND OIL-TRADE) to the invention of some mode of using oil as a fuel for furnaces and stoves. Such attempts had often been made before; but they assume a new aspect now that oil has become so much cheapened. Nearly half the carrying capacity of European steamships, and more than half in those which make long voyages, is taken up with the stowage of coal. Petroleum (q.v.) gives out nearly twice as much heat as an equal weight of anthracite or steam coal.

As respects the use of petroleum for raising steam, several reports have been made public, stating that it has been so employed with success; but a careful examination of the most reliable experiments plainly shows that as yet, at any rate, this cannot be done economically, except in rare instances, such as in the oil regions of the United States. In a full and apparently very reliable report on petroleum in all its bearings by Mr. J. Lawrence Smith, published in the general report of the judges of group. III., Philadelphia exhibition of 1876, it is stated that the average price of anthracite coal in America is eight dollars per ton, and at this rate petroleum for equal heating-power would cost three times as much. In Great Britain, where paraffine oil is as cheap as petroleum, the advantage in the use of coal is much greater. The reports of Mr. T. Lloyd to the English admiralty, and by Mr. Isherwood, chief of the bureau of engineering in the U. S. navy, agree in stating that, although mineral oils can be burned without difficulty for raising steam, it has yet to be proved whether they can be used successfully and safely at sea. The eminent French chemist, St. Claire Deville, has perhaps made what are as yet the most trustworthy experiments respecting the burning of mineral oils for raising steam in locomotives. He considers that only the heavy and thick-flowing kinds can be used to advantage in heating these engines; that with heavy oil steam can be got up in the same time as with coal; and that, as compared with the latter, the oil required is only about one-half the weight. On one of the railways in the s. of Russia, the petroleum found at Baku, on the Caspian sea, was burned for a time in the locomotives; but although a success from an engineering point of view, it was found to be too costly a fuel. For a drawing of the furnace used, see *Engineering* for Jan. 5, 1877.

The chief advantages of petroleum compared with coal as a fuel in raising steam are its greater heating-power, the smaller storage space it requires, and its freedom from ash. Its disadvantages are greater cost, difficulty in burning without much smoke or tarry deposits, and the danger attending its use.

More success has attended the use of petroleum in metallurgical processes. Its freedom as a fuel from deleterious ingredients gives it at once a great advantage here. One of the best petroleum furnaces for working iron is that designed by Dr. C. J. Eames, now at work in Jersey City, U. S. The petroleum is made to drip over a series of shelves in an iron vessel, and is there converted into vapor and carried forward by superheated steam to be mixed with air, and is then immediately burned in the "combustion-chamber" at the end of the furnace, close to where the iron is piled. Steam in one condition or another is used to convert the petroleum into vapor in most furnaces where it is used. In furnaces for bending armor-plates, and also for working thinner iron plates, mineral oil has been found to have the advantage over coal of raising the heat required in a much shorter time. It also produces less scale on the iron, and with it the heat is more easily concentrated on a portion of the plate.

OILLE'TS, or ŒILLETS, small openings. often circular, used in mediæval buildings for discharging arrows, etc., through.

OIL MILL. See OILS.

OIL PALM, *Elæis*, a genus of palms, of the same tribe with the cocoa-nut palm. The best known species, the oil palm of tropical Africa, sometimes attains a height of 60 to 80 feet. The stems are thickest in the middle, tapering chiefly upwards. The leaves are pinnate, their footstalks spiny. The flowers have a strong peculiar smell, like that of anise or chervil. The fruit forms an immense head, like a great pine-apple, consisting of a great number of bright orange-colored drupes, having a thin skin, an oily pulp, and a hard stone. The pulp of the drupes, forming about three-fourths of their whole bulk, yields, by bruising and boiling, an oil, which when fresh has a pleasant odor of violets, and when removed into colder regions acquires the consistency of butter. This oil is now very largely imported from tropical Africa into Britain, and is much used for many purposes, as for making candles, toilet soaps, etc., and for lubricating machinery and the wheels of railway carriages. When fresh, it is eaten like butter. See OILS. The nut was formerly rejected as useless after the oil had been obtained from the fruit; but from its kernel a fixed oil is now extracted, called PALM-NUT OIL; which is clear and limpid, and has become to some extent an article of commerce. The

oil palm abounds in mangrove swamps, but is also a conspicuous feature of the landscape on sandy coasts in the tropical parts of western Africa. It yields from its trunk abundance of a pleasant and harmless beverage, which, however, becomes intoxicating in a few hours, called *malova* in Angola, and much used there as an alcoholic stimulant. The unripe nuts of the oil palm are used in some parts of Africa for making an excellent kind of soup. The oil palm has been introduced into some parts of America, and is now abundant in them.

OIL-REFINING. Several oils, from the mode of their extraction, are necessarily impure, and various means are taken for refining or purifying them: thus, the so-called *fish-oils*—that is, whale, seal, cod, etc.—are clarified either by mixing them with a chemical solution, or by passing steam through them and filtering through coarse charcoal. The chemical solutions employed are various. One method is, to use a strong solution of oak bark, the tannic acid in which combines with the albuminous matters present in the oil, and precipitates them; another plan is, to agitate bleaching-powder, formed into a milk with water, with the oil; and then, after subsidence of the chloride of lime and water, to wash the oil with water, or jets of steam passed through it. A more simple and very effective plan, invented by Mr. Dunn, is to apply a steam heat not exceeding 200° F., and then pass a current of air of the same temperature through it continuously for some time: this effectually bleaches the oil.

Olive, and some other vegetable oils, are refined by agitating them with a saturated solution of caustic soda. This renders the whole soapy; but after a time the oil precipitates a saponaceous deposit, and the remainder becomes quite clear and pure, and is then poured off. The value of several of the most important oils of commerce is so greatly increased by refining, that this art has now become a very important branch of business, and is carried out on a large scale.

OILS (including fats). The fats and fixed oils constitute an important and well-marked group of organic compounds, which exist abundantly both in the animal and vegetable kingdoms. They are not simple organic compounds, but each of them is a mixture of several such compounds to which the term *glycerides* is applied; and the glycerides which by their mixture in various proportions form the numerous fats and oils are mainly those of palmitic, stearic, and oleic acids—if we adopt the recent view that margaric acid (q.v.) has no independent existence—and to a less extent those of other fatty acids, which will be presently noticed, such as butyric, caproic, caprylic, and capric acids, which are obtained from butter; myristic acid, which is obtained from cocoa-nut oil, etc. The members of this group may be solid and hard, like suet; semi-solid and soft, like butter and lard; or fluid, like the oils. The solid and semi-solid are, however, generally placed together and termed fats, in contradistinction to the fluid oils. The most solid fats are readily fusible, and become reduced to a fluid or oily state at a temperature lower than that of the boiling-point of water. They are not volatile, or, in other words, they cannot be distilled without decomposition, and it is not until a temperature of between 500° and 600° is reached that they begin nearly simultaneously to boil and to undergo decomposition, giving off acroleine (an acrid product of the distillation of glycerine) and other compounds. In consequence of this property, these oils are termed *fixed oils*, in contradistinction to a perfectly separate group of oily matters, on which the odoriferous properties of plants depend, and which, from their being able to bear distillation without change, are known as *volatile oils*. These, which are also known as *essential* or *ethereal oils*, differ *in toto* in their chemical composition from the compounds we are now considering, and will be separately noticed in the latter part of this article. All the fats and oils are lighter than water, and are perfectly insoluble in that fluid. Their specific gravity ranges from about 0.91 to 0.94. They dissolve in ether, oil of turpentine (one of the volatile oils), benzole, and to a certain extent in alcohol; while, on the other hand, they act as solvents for sulphur, phosphorus, etc. If a fatty matter be shaken with a watery solution of albumen, gum, or some other substance that increases the density of the water, and renders it viscid, the mixture assumes a milky appearance, in consequence of the suspension of the fat or oil in the form of microscopic globules, and is termed an *emulsion*. These bodies possess the property of penetrating paper and other fabrics, rendering them transparent, and producing what is well known as a greasy stain. They are not readily inflammable unless with the agency of a wick, when they burn with a bright flame. In a pure and fresh state they are devoid of taste and smell, but on exposure to the air they become oxidized and acid, assume a deeper color, evolve a disagreeable odor, and are acrid to the taste; or, in popular language, they become *rancid*. The rapidity with which this change occurs is considerably increased by the presence of mucilaginous or albuminous bodies. The rancidity may be removed by shaking the oil in hot water in which a little hydrated magnesia is suspended.

The general diffusion of fats and oils in the animal kingdom has been already described. (See FATS, ANIMAL.) In the vegetable kingdom they are equally widely distributed, there being scarcely any tissue of any plant in which traces of them may not be detected; but they are especially abundant in the seeds. The seeds of the *cruciferæ* are remarkably rich in oil; linseed yielding fully 20 per cent and rape-seed about 40 per cent of oil; and some fruits, as those of the olive and oil-palm, yield an abundance of oil.

The uses of the oils and fats are numerous, and highly important, various members of this group being extensively employed as articles of food, as medicines, as lubricat-

ing agents, in the preparation of soaps, plasters, ointments, varnishes, pigments, candles and other means of illumination, for the purpose of dressing leather, etc. The following are the most important members of the group:

1. *Vegetable Fats.*—The chief solid fats of vegetable origin are cocoa-nut oil, nutmeg butter, and palm oil. The fluid vegetable fats or oils are divisible into the *non-drying* and the *drying oils;* the latter being distinguished from the former by their becoming dry and solid when exposed in thin layers to the air, in consequence of oxygenation; while the former do not absorb oxygen, but are converted by hyponitric acid or sub-oxide of mercury into elaidine (as described in the article OLEINE), a reaction which is not exhibited by the drying oils. Some of the drying oils, especially linseed oil, when mixed with cotton, wool, or tow, absorb oxygen so rapidly, and consequently become so heated as to take fire, and many cases of the spontaneous combustion of heaps of oily materials that have been employed in cleaning machinery have been recorded. The drying property may be much increased by treating the oils with a little litharge or oxide of manganese, and linseed oil thus treated is then known as *boiled oil.* The chief non-drying oils are olive oil, almond oil, and colza oil; while the most important drying oils are those of linseed, hemp, poppy, and walnut; castor oil seems to form a link between these two classes of oils, since it gradually becomes hard by long exposure to the air.

2. *Animal Fats.*—The chief solid fats are suet, lard, butter, goose grease, etc.; while among the fluid fats or oils, sperm oil, ordinary whale oil, cod-liver oil, and neat's-foot oil may be especially mentioned. In many of their characters, spermaceti and bees-wax resemble the solid fats, but, as will be shown in the articles on these subjects, they are not glycerides. As a general rule, stearine and palmitine, both of which have comparatively high fusing points (between 157° and 114°), preponderate in the solid fats; while oleine, which is fluid at 32°, is the chief constituent of the oils.

One or two of the most important of the decompositions of the fats must be noticed. When any of these bodies are heated with the hydrated alkalies, they undergo a change which has long been known as saponification, or conversion into soap (q. v.), in which the fatty acid combines with the alkali to form a *soap*, while the sweet viscid liquid glycerine is simultaneously formed. The combination of a fatty acid with oxide of lead forms a *plaster.* For further details on these points, the reader is referred to the articles SOAP and PLASTERS.

The process of saponification affords a ready means of isolating the fatty acids, as the stearic or oleic acid may be at once separated from an alkaline stearate or oleate by the addition of hydrochloric or tartaric acid. When the fatty acids are, however, required on a large scale, as for the manufacture of the so-called stearine-candles, which in reality consist mainly of stearic and palmitic acids, sulphuric acid and the oil or fat are made to act upon each other at a high temperature. See CANDLE. The fatty acids may also be procured in a very pure form by the injection of superheated steam at a temperature of between 500° and 600° into heated fat—a process which, according to prof. Miller, "from its simplicity and from the purity of the products which it yields, bids fair to supersede those previously employed in the preparation of the fatty acids for illuminating purposes."

The only fatty acids which have been specially mentioned in this article are those which occur in natural glycerides, such as stearic, palmitic, and oleic acids. The term *fatty acid* has, however, in chemistry a wide signification, and is applied to many acids homologous to stearic acid, but not occurring in any natural fats or oils. Thus stearic acid may be taken as the type of a group of acids (of which seventeen are already known) represented by the general formula, $C_{2n}H_{2n}O_4$, commencing with formic acid ($C_2H_2O_4$), including acetic, propionic, butyric, valeric (or valerianic), caproic, œnanthylic, caprylic, pelargonic, capric, lauric, myristic, palmitic, stearic, arachidic, and cerotic acids, and terminating with melissic acid ($C_{60}H_{60}O_4$). These are divided into the volatile and the true (or solid) fatty acids; the volatile acids being those from formic to capric acid, while the remainder, beginning with lauric acid, are the true fatty acids. The *volatile fatty acids* are fluid, and for the most part oily at ordinary temperatures, may be distilled without change, possess a pungent odor, and are acid to the taste, and their solutions redden litmus paper strongly. The *true fatty acids*, on the other hand, are solid at ordinary temperatures, are devoid of taste and smell, cannot be distilled, except *in vacuo*, without decomposition, and only exert a slight action on litmus. The volatile acids occur in the animal and vegetable kingdoms (formic acid, for example, in red ants, and valeric acid in the root of valerian), and they are likewise produced by the oxidation and spontaneous decomposition of numerous animal and vegetable products. The entire series, up to capric acid, may be obtained by oxidizing oleic acid with nitric acid. The true or solid acids only occur as constituents of animal and vegetable fats.

Prof. Miller makes a second group of fatty acids, of which oleic acid is the type, and which have the general formula $C_{2n}H_{2n-2}O_4$; but as oleic acid is the only member of this group which is of any practical importance, it is sufficient to refer the reader to the special article on that acid.

A complete list of even the chief fats and fixed oils would take up far more space than we can command. In the article "Fixed Oils," in *The English Cyclopædia*, the reader will find 64 of the most important of these substances mentioned, with, in most

cases, a brief notice of the origin and properties of each. The British pharmacopœia contains hog's lard, mutton suet, cod-liver oil, concrete oil (or butter) of nutmeg, and almond, castor, croton, linseed, and olive oils, besides the closely allied substances spermaceti and wax.

The *Volatile* or *Essential Oils* exist, in most instances, ready formed in plants, and are believed to constitute their odorous principles. They form an extremely numerous class, of which most of the members are fluid; a few (oil of aniseed, for example) being solid at ordinary temperatures, but all of them are capable of being distilled without undergoing change. They resemble the fixed oils in their inflammability, in their solubility in the same fluids, and in their communicating a greasy stain to paper or any other fabric; but the stain in this case soon disappears, and they further differ in communicating a rough and harsh rather than an unctuous feeling to the skin. Their boiling points are in almost all cases far higher than that of water, but when heated with water they pass off with the steam—a property on which one of the chief modes of obtaining them depends. See PERFUMERY. The oils have characteristic penetrating odors, which are seldom so pleasant as those of the plants from which they are obtained, and their taste is hot and irritating. They vary in their specific gravity, but most of them are lighter than water, and refract light strongly. Most of them are nearly colorless when fresh, but darken on exposure to light and air; but a few are green, and two or three of a blue color. By prolonged exposure they absorb oxygen, and become converted into resins.

By far the greater number of them are products of the vital activity of plants, in which most of them exist ready formed, being inclosed in minute cavities, which are often visible to the naked eye. Although diffused through almost every part of a plant, the oil is especially abundant in particular organs of certain families of plants. In the *umbelliferæ*, it is most abundant in the seeds; in the *rosaceæ*, in the petals of the flowers; in the *myrtaceæ* and *labiatæ*, in the leaves; in the *aurantiaceæ*, in the rind of the fruit. As in the case of the animal and vegetable fats and fixed oils, so most of the essential oils occurring in plants are mixtures of two or more distinct chemical compounds, one of which usually contains no oxygen, while the others are oxidized. Of these, the former, which is a pure hydrocarbon, is the more volatile, and acts as a solvent for the others. Most of these oils, when cooled, separate into a solid and a fluid portion, to which the terms *stearopten* and *elæopten* have been applied.

In the comparatively few cases in which the oils are not formed naturally, they are produced by a species of fermentation, as in the case of oil of bitter almonds and oil of mustard (q.v.), while others are the product of the dry distillation or of the putrefaction of many vegetable bodies. Some of the natural oils, as those of cinnamon, spiræa, and winter-green, have also been artificially produced.

The essential oils are much employed in the fabrication of perfumery (q.v.), for the purpose of flavoring liquors, confectionary, etc., for various purposes in the arts (as in silvering mirrors), and in medicine. The special uses of the most important of these oils in medicine will be noticed subsequently.

The members of this group, which is an extremely numerous one (more than 140 essential oils being noticed in the article on that subject in the *The English Cyclopædia*), admit of arrangement under four heads. 1. Pure hydrocarbons; 2. oxygenoue essential oils; 3. sulphurous essential oils; 4. essential oils obtained by fermentation, dry distillation, etc.

1. The *pure hydrocarbons* are for the most part fluid, and have a lower specific gravity, a lower boiling point, and a higher refractive power than the oxygenous oils. They absorb oxygen, and are converted into oxygenous oils and resins. They may be separated from oxygenous oils, with which they are usually associated, by fractional distillation. They include oil of turpentine ($C_{20}H_{16}$), and the oils of bergamot, birch, chamomile, caraway, cloves, elemi, hop, juniper, lemons, orange, parsley, savine, and valerian, most or all of which contain the same hydrocarbon as oil of turpentine (q.v.), and in addition to it an oxidized compound; oil of copaiva ($C_{30}H_{24}$), attar of roses ($C_{16}H_{16}$), etc.

2. The *oxygenous essential oils* may be either fluid or solid, the latter being also termed *camphors*. A stearopten separates from most of the fluid oils on cooling. They are more soluble in water and spirit of wine than the pure hydrocarbons. They may be divided into (1) those which are fluid at ordinary temperature, such as those of anise-seed, chamomile,* cajeput, caraway,* cinnamon, cloves,* fennel, lavender, peppermint, rue, spiræa, thyme,* winter-green, etc. Those marked with a (*) are associated with the pure hydrocarbons already described. (2) The camphors, such as ordinary camphor ($C_{20}H_{16}O_2$), Borneo camphor ($C_{20}H_{18}O_2$), etc.

3. The *sulphurous essential oils* are chiefly obtained from the *cruciferæ*. They probably all contain the radical *allyl* (C_6H_5). The oils of garlic and of mustard (both of which have been described in special articles), and those of horse-radish, scurvy-grass, and asafœtida, are the best illustrative of this division.

4. Among the essential oils obtained by fermentation, dry distillation, etc., may be mentioned the oils of bitter almonds and of black mustard, the oils of milfoil, plantain, centaury, etc. (whose leaves have no smell until they have been moistened for some time with water, when a kind of fermentation is set up, and oil is yielded in abundance), furfuramide (q.v.), etc.

The British pharmacopœia contains the essential oils of anise, cajeput, caraway, chamomile, cinnamon, cloves, copaiva, coriander, cubebs, dill, juniper, lavender, lemon, nutmeg, peppermint, pimento, rosemary, rue, savine, spearmint, and turpentine. Of these the oils of anise, cajeput, caraway, chamomile, coriander, dill, peppermint, pimento, and spearmint are used as stimulants and antispasmodics in cases of flatulence, griping, etc.; and to disguise the nauseous taste of various medicines. The oils of cajeput, cinnamon, and rue act similarly but more powerfully. The oils of copaiva and cubebs act in the same manner as the substances from which they are derived; oil of juniper is a powerful diuretic, and oil of savine (and to a less extent oil of rue) an emmenagogue. The oils of lavender and lemon are used to conceal the smell of sulphur ointment, and to give an agreeable odor to lotions, etc. The oil of rosemary is chiefly employed as a stimulating liniment, especially in cases of baldness; and the oil of nutmeg is seldom given medicinally except in the form of aromatic spirit of ammonia, into the composition of which it enters.

A very admirable paper on the essential oils was read Dr. Gladstone before the chemical society, in the month of Dec., 1863; and the reader who is anxious to pursue the subject further will find it advantageous to refer to this excellent production.

Bland oils—such, for example, as olive-oil—were much used by the ancients as external applications in various forms of disease. Celsus repeatedly speaks of the use of oil applied externally with friction in fevers, and in various other diseases. Pliny says that olive-oil warms the body and at the same time cools the head, and that it was used with these objects previously to taking cold baths. Aretæus recommends a sitz-bath of oil in cases of renal calculi, and Josephus relates that a similar mode of treatment was employed in the case of Herod. Galen prescribed "oil and wine" for wounds in the head; and the parable of the good Samaritan affords additional evidence that this was a common mode of treating wounds. The use of oil preparatory to athletic exercises is referred to by numerous Greek and Latin writers.

As a cosmetic—that is to say, as a means of giving to the skin and hair a smooth and graceful appearance—its use has been prevalent in hot climates from the earliest times. There is abundant historical evidence of this usage of oil amongst the Egyptians, the Jews, the Greeks, and the Romans; and Pliny's statement that butter is used by the negroes, and the lower class of Arabs, for the purpose of anointing, is confirmed by the observation of all recent African travelers. In hot climates there is doubtless a practical as well as an æsthetic object in anointing. The oil, being a bad conductor of heat, affords a certain amount of protection against the direct action of the solar heat; it is likewise serviceable as a protection against the attacks of insects, and as a means of checking excessive perspiration. The fact of oily and fatty matters being bad conductors of heat, serves also to explain why the Esquimaux and other dwellers in Arctic regions have recourse to the inunction of the blubber, etc. In their case the oily investment serves to prevent the escape of the bodily heat.

The Greeks and Romans not only employed oil for the purposes already mentioned, but in their funereal rites; the bodies of their dead being anointed with oil, with the view probably of postponing incipient decomposition. A similar practice existed amongst the Jews, and in the Gospels we find various passages in which our Lord referred to his own body being anointed by anticipation. It appears from the evidence of St. Chrysostom, and other writers, that this ancient usage of anointing the bodies of the dead was long retained in the Christian church. See Unction; Extreme Unction.

In conclusion we may remark that the ancient system of anointing as a means of medical treatment, has to a certain extent been revived in modern times. Many physicians of the present day combine the inunction of cod-liver oil with its internal administration, a combination first recommended by professor Simpson of Edinburgh; and sir Henry Holland advocates the practice of anointing the harsh, dry skin of dyspeptic patients with warm oils. There can, we think, be little doubt that there are many forms of disease in which the local application of medicinal oils would prove advantageous; but the great drawback to their use is that the time required for properly rubbing them into the skin is more than most patients are willing to concede. For much curious information on the subject of this article, the reader is referred to a very interesting paper by Mr. Hunter, "On the External Application of Oils," in the second volume of *The Edinburgh Medical and Surgical Journal.*

Oils in their Commercial Relations.—The solid animal oils found in commerce are butter and lard, tallow, mares' grease, goose grease, neats-foot oil, and unrefined yelk of egg oils. The two first are fully described under their names. See Butter, Lard. Tallow is the fat of oxen and sheep, but more especially the fat which envelops the kidneys and other parts of the viscera, rendered down or melted. The qualities of this solid oil render it particularly well adapted for making candles, and until the end of the first quarter of the present century, candles for ordinary use were almost wholly made of it, the high price of wax and spermaceti preventing their employment except by the most wealthy and for ecclesiastical purposes. Besides its use in making candles, tallow is most extensively used in the manufacture of soap, and for the purpose of preserving machinery from rust. The trade in tallow with Russia, which produces the best, and with North and South America, and even with India and other countries is very considerable; but it is declining, owing of course to the extension of gas and the enormous

development of the paraffin, and petroleum oils (q.v.), and other light-giving materials. The quantities of tallow and stearine imported in five recent years into Britain were as follows:

	Tons.	Value.
1871	1,247,064	£2,996,258
1872	1,232,144	2,792,570
1873	1,527,321	3,847,271
1874	1,155,243	4,172,113
1875	967,396	4,338,166

The chief use of tallow in this country is now in the manufacture of soap (q.v), and even in this it has yielded in importance to palm and cocoa-nut oils.

Mares' grease is not nearly so solid as tallow;. it is a yellowish-brown grease, imported extensively from Monte Video and Buenos Ayres, where vast numbers of horses are slaughtered for their hides, bones, and grease; it is particularly valuable as a lubricant for machinery, and is chiefly employed for that purpose after much of its stearine has been removed for candle-making. The reason this material is called *mares'* grease is said to be from the circumstance that in South America horses are chiefly used alive, and mares are slaughtered as comparatively useless. Goose grease is another soft fat, much valued by housewives for many purposes, but excepting that it is sold in some districts as a remedial agent, it has no commercial importance. Neats-foot oil is a soft fat procured in the preparation of the feet and intestines of oxen for food as sold in the tripe-shops. The quantity obtained is not very great, but it is in much request by curriers for dressing leather. Yelk of egg oil is a hard oil, which, though little known in Britain, is extensively used in other countries where eggs are cheaper. In Russia, for instance, it is manufactured on so large a scale as to supply some of the largest makers of fancy soaps, and it forms the principal material in the celebrated Karan soap; and certain pomades are made of it which have a great reputation, and realize very high prices. This oil is not unlike palm-oil in color and consistency; but when refined is liquid, and has a reddish-yellow color. Its price at Moscow is as high as 8s. per lb.

The liquid animal oils are more numerous, and, excepting tallow, are far more important, the so-called fish-oils being the principal. These are whale, porpoise, seal, cod, herring, shark, etc. The whales which are pursued for their oil are: 1. The sperm whale. This huge creature is from 60 to 70 ft. in length, and yields generally from 5,000 to 6,000 gallons of oil. The finest oil is taken from the great reservoir on the head. The oil of this species is all of a quality superior to others, and is known as sperm oil. For the method of procuring this oil, see CACHOLOT. 2. The right whale, which yields by far the largest proportion of whale oil. This, with that yielded by other less important species, is usually called train oil. The term *train* is supposed to be a corruption of *drain*, and applies to the circumstance of the oil being drained out of the blubber; and in this sense it is also applied to sperm oil from the blubber of the cacholot, in contradistinction to the finer oil from the head matter. The right whale forms the chief object of the northern fisheries, but other species of balæna are pursued in different parts of the world for the sake of their oil. See WHALE.

Amongst the smaller cetaceans, the porpoises—called also dolphins ("puffydunters" on the east coast of Scotland)—and grampuses yield an excellent oil, second only in value to that of regular oil whales; and to obtain it, large numbers are occasionally killed in the British seas. The price of sperm oil ranges from £80 to £95 per tun, and that of ordinary train oil from £40 to £45 per tun of 252 gallons. The imports and consumption of the various kinds of whale oil for the five years 1871 to 1875 were as follows:

	Tuns.	Value.
1871	20,679	£1,087,734
1872	18,719	855,590
1873	17,886	766,927
1874	17,051	751,359
1875	19,359	917,701

A large quantity of very valuable oil is obtained from seals; and the seal-fishery, as a means of obtaining oil, is only second in importance to that of the whale. It is carried on chiefly on the shores of Newfoundland, Greenland, and Labrador. Like the whales, the seals have a thick layer of blubber in which the oil is contained. See SEAL. The first draining from the blubber is of a fine, clear, pale straw-color; the next, yellow or tinged; and the last is brown or dark. The price ranges in our markets at about £35 to £40 per tun for pale, £30 to £35 for yellow, and £28 to £30 for brown. The whale and the seal oils are nearly all used for burning in lamps, and for this purpose they are admirably adapted by their great illuminating power. They are also the best lubricants for machinery.

Of the true fish oils, that from the cod is first in importance, more especially since its medicinal properties were discovered. It is made only from the liver of the fish; and the attempt which was made to induce a popular belief that the so-called cod-liver oil was different from the ordinary cod oil of commerce, was simply a cheat; no difference exists, and the oil is obtained just as good from the oil merchant at a moderate price per gallon as from the empiric at an exorbitant price per pint. Indeed, the purer the oil

can be got, the better it is in a remedial point of view, notwithstanding the efforts made to convince the public that a certain color is better than any other.

Instead of the old and somewhat rude methods of preparing the oil (see Cod-liver Oil), much more complete and efficient arrangements are now adopted. The livers, when taken from the fish, are all examined, washed in clean water, and placed in sieves to dry. Thence they are transferred to pans heated with steam, and after being exposed to a gentle heat for about three-quarters of an hour, the heat is discontinued; and when cold, the oil which has separated is skimmed off, and strained through flannel bags into tubs. Here certain impurities subside, and the clear oil is poured off from the dregs, and the contents of numerous tubs are transferred to galvanized iron cisterns, in which a further settlement takes place. The oil is now ready for the filters, which are made of the strong cloth called moleskin, through which it is forced by atmospheric pressure into the store-tanks, which are also of galvanized iron. Hence it is pumped into the casks for export, which are usually hogsheads, tierces, and barrels. The value of cod-liver oil is about £34 to £40 per ton. The imports vary much according to the success of the fishery; they have reached nearly 1000 tons per annum. Besides its consumption in lamps, and for medicinal purposes, cod oil is used in making some kinds of soap. Oil is occasionally made from the herring, but not in very great quantities; it, however, forms a commercial article. It is made from the whole of the fish, the smell of which it retains to a very disagreeable extent.

The lightest of all the fixed oils is made from the liver of the common shark; it ranges from specific gravity 0.865 to 0.867. This, and the oil made from the livers of the common skate (*Raia batis*), the Thornback (*R. clavata*), and the white skate (*Rhinobatus cerniculus*), are often substituted for the cod-liver oil used medicinally, but have not its valuable properties.

Under the name of lard oil, large quantities of the oleine of lard have been imported of late years from America. It is a secondary product, arising from the great manufacture of lard stearine for candle-making which has arisen in that country. Lard oil is worth about £45 to £53 per ton, and is principally used as a lubricant for machinery.

The solid vegetable fixed oils which find a place in commerce are palm oil, cocoa-nut oil, kokum or vegetable tallow, and carapa or carap oil. The palm oil is an oil of a bright orange-yellow color and an agreeable violet odor; it is obtained from the not very thick covering of the hard seeds of the oil-palm (q.v.). The fruits, when gathered, are shaken out of the clusters, and are laid in heaps in the sun for a short time, after which the natives boil them slowly in water, when the oil separates and is skimmed off the surface, and carried in small quantities to the depôts of the traders, who transfer it to casks which are prepared to receive it on board the ships. The quantity thus collected is enormous. The imports into Britain alone for the five years 1876–1880 were as follows, in tons weight: ('76) 879,824; ('77) 897,264; ('78) 670,797: ('79) 881,329; ('80) 1,032,823. Previous to 1840, the chief use of palm oil was in making soap, but it was about that time found that the palmitine or fat acid of this oil was admirably adopted for the manufacture of candles (q.v.); and since then it has become of much greater importance.

Cocoa-nut oil is a white fat, with the peculiar smell of the kernel; it is made by grinding or pounding the kernel of the cocoa-nut. After it has been boiled in water for a short time, the paste is submitted to great pressure, and a large quantity of milky juice is obtained; this is slowly boiled, and the oil separates and rises to the surface in considerable quantity, and is skimmed off. Twenty ordinary-sized nuts will yield as much as two quarts of oil. This oil is now very largely imported, and, treated in the same way as palm oil, forms a stearine, which greatly improves that of palm oil when mixed with it in proper proportions; neither does so well separately, and the consumption of cocoa-nut oil has consequently very greatly increased. Most of it comes from Ceylon, where the tree is largely cultivated on purpose. The imports in 1870 were 9,930 tons; in 1872, 21,469 tons; and in 1880, 38,454 tons. By far the greater proportion of this vast quantity is used by the candle manufacturers, and the remainder in making common soap, its disagreeable smell preventing it being employed for the better kinds.

Vegetable tallow, or kokum oil, is also used by the candle-makers; only small quantities, however, are imported. It comes from Singapore, and is produced from the seed of *Garcinia purpurea*, a species of the same genus with the mangosteen. Another kind of vegetable tallow is made in China, from the seeds of *Stillingia sebifera*.

Carapa, carap, crab, or Andiroba oil, is very extensively made in British Guiana and the West Indies, but it is nearly all used there, either as a pomade for preserving the hair, or as an unguent for rheumatism and neuralgic pains, for which purposes it is said to be very useful. See Carapa.

The Bassia oil is beginning to attract attention, and several importations have taken place from India, and some rather large quantities have reached Liverpool from Bombay, under the name of Muohwa oil. This oil is of a soft butter-like consistence, and yellowish-green color, and is well adapted for soap-making, and for machinery grease. See Bassia.

The liquid vegetable oils are very numerous, and several are of great commercial importance. First in rank is olive oil, made from the ripe fruit of the common olive (*olea Europea*). When good and fresh, it is of a pale greenish-yellow color, with scarcely any smell or taste, except a sweetish nutty flavor, much esteemed by those who use it.

The finest qualities are the Provence oil (rarely seen in Britain), Florence oil, and Lucca oil. These are all used for salads and for cooking. The Genoa is used on the continent for the same purposes; and Galipoli, which is inferior, constitutes the great bulk of what is received in this country for cloth dressing, Turkey-red dyeing, and other purposes; the continental soap-makers also employ it extensively. The high price of the best qualities leads to much adulteration with poppy and other oils, but it is generally pretty safe when in the original flasks as imported. The mode of obtaining the finest kinds is by gentle pressure of the fruit. The cake is afterwards treated with hot water, from the surface of which an inferior quality is skimmed. The Galipoli oil is obtained by allowing the olives to ferment in heaps, and then to press them in powerful oil-presses; the cake or *marc* is then treated with water once or twice, until all the oil is removed; this inferior oil is darker in color, being a yellowish or brownish green. We receive the finest from Italy, and the commoner qualities from the Levant, Mogador, Spain, Portugal, and Sicily. The present values range from £44 to £54 for common kinds, and the finest Lucca is £1 the half-chest, or nearly £85 per tun measure. The total quantity imported during the four years 1877–80 was as follows: 1877, 31,271 tuns; 1878, 20,615 tuns; 1879, 26,198 tuns; 1880, 20,260 tuns.

Nearly all the other liquid vegetable oils of this class are obtained from seeds, and as they are most of them treated in the same way, one description will suffice. First, the seeds are ground—and this in Britain is always done by vertical stones (see MILL)—into a kind of coarse meal, which is first warmed in pans, and then put in certain portions in woolen cloths or bags, so arranged as to be of uniform thickness; these are again wrapped in horse-hair cloths, and each parcel is placed between two flat boards slightly fluted on their inner sides, and then placed in the wedge press. In this *a*, *a* are two flannel bags filled with the meal and inclosed in horse-hair bags, each flattened between the flat boards, *b*, *b*, *b*, *b*. They are set upright, between the pressing-plates, *i*, *i*, *i*, *i*, one at each end of the press-frame, *ccc*, which is made of great strength, and often of cast-iron. Next is placed the wedge *d*; the other wedge, *e*, is then suspended by a cord in the position represented; *h*, *h* are then placed, as seen in the drawing; the main wedge, *g*, is lastly inserted, and the press is ready for action. The operation is very simple; a heavy wooden stamper, from 500 to 600 pounds weight, is raised by machinery about two feet, and allowed to fall upon the wedge *g*. This tightens all the other wedges and pressing-plates, and exerts a pressure of about 60 tons on each bag when fully driven home. The pressing-plates, *i*, *i*, *i*, *i*, are pierced with holes, and so are the plates *b*, *b*, *b*, *b*; and through these holes the oil trickles and passes away through a pipe at the bottom.

One of the chief seed oils is that of linseed (q.v.). Very little linseed oil is imported into Britain; the improved machinery, and the great demand for the oil-cake (see OIL-CAKE), causes it to be manufactured at home, and at present it is exported in considerable quantities; thus, from Hull alone there was exported in 1880, of seed oil, expressed chiefly from foreign seed, no less than 5,890,500 gallons, and over 10,000 tons of oil-cake; and from London and Liverpool together about the same quantity. The total production of Great Britain for 1868 was estimated at 65,000 tons; for 1869, 61,000 tons; for 1871, 69,000 tons; and for 1872, 67,000 tons. In 1880, 14,508,000 gallons of seed-oil were exported. It is worth about £36 per ton. Rape or colza oil is a name which covers the product of several cruciferious seeds, as rape, turnip, and other species of *brassica*, radish, *sinapis toria*, gold of pleasure, etc. The oil is clear brown and usually sweet, but with a mustard-like flavor; its illuminating powers are excellent, and it is also well adapted for wool-dressing. Very large quantities are made in Great Britain, chiefly from *sinapis toria* and other Indian mustard seeds, which are imported under the name of Surzee seed. The imports of these seeds are occasionally as much as 60,000 quarters per annum. Hemp seed yields a green oil which is much used in making soft soap, especially in Holland. In Russia it is eaten with various kinds of food, and is greatly liked by all classes.

The following are the names of a number of oils which are more or less used in Grt. Britain: Cotton-seed oil. Palm-nut oil, a cleared limped oil from the hard nut of the oil-palm; this nut was formerly rejected as useless after the oil had been obtained from the fruit. Safflower-seed oil, from the seeds of *carthamus tinctorius;* it constitutes the real Macassar oil. Sunflower-seed oil, from seed imported from the Black sea provinces of Russia; a rapidly increasing trade is springing up in this excellent oil. Poppy-seed oil, from the seed of *papaver somniferum*, largely imported from India; it is as sweet as olive oil, and is extensively substituted for it, especially in France, where it is also very largely cultivated. Gingelli-seed oil, from the seed of *sesamum orientale*, an important Indian staple of which we are large consumers; the oil is much used for wool dressing, etc. Ground-nut oil, from the seeds of *arachis hypogœa*, imported from western Africa and India; this oil is particularly adapted for fine machinery, as it is not affected by cold. Niger, til, or teel-seed oil, from the seeds of *Guizotia oleifera*, much imported from Bombay. Croton oil, from the seeds of *jatropha curcas*, largely used in wool dressing. The croton oil used in medicine is from *croton tiglium*, of which only small quantities are imported; whereas of the other 1200 or 1400 tons, besides a quantity of the seed, often reach us in one year. Another highly valuable medicinal oil, castor oil (q.v.), is of great commercial importance. Almond oil, chiefly used for perfumery purposes, is made from

the kernels of the sweet and bitter almond; it is the most free from flavor and odor of any oil in use, notwithstanding that the essential oil of bitter almonds is so strongly flavored.

Oils made from the seeds of the following plants have some commercial value in other countries: *Madia sctiva; argemone Mexicana;* various species of gourds; garden cress (*lepidium sativum*); tobacco, now extensively used in southern Russia, Turkey, and Austria; hazel-nuts; walnuts; nuts of stone pine; pistachio nut; tea-seed; this in China is a common painter's oil; the grape, from the seeds or stones, as they are called, saved from the wine-presses, used in Italy; Brazil-nuts (*Bertholetia excelsa*); *calophyllum inophyllum,* called pinnacottay oil in India; *melia azadirachta,* called in India by the names meem and margosa oil; *aleurites triloba,* called in India country almond oil, and much used for burning in lamps and torches; *psoralea corylifolia,* called baw-chee-seed oil. The seed is sometimes imported to this country for pressing. Ben-seeds (*moringa pterygosperma*); bon-duc-nuts, the seeds of *guilandina bonduc* and *G. bonducella.*

The following oils, new to European commerce, were shown in the international exhibition of 1862. *India.*—Teorah oil, from the seeds of *brassica erucastrum;* capala oil, from the seeds of *rottlera tinctoria;* cardamom oil, from the seeds of *elettaria cardamomum;* hidglee badham oil, from the seeds of *anacardium occidentale,* or cashew-nut, now largely cultivated in India; cassia-seed oil; chaulmoogra oil, from the seeds of *hydnocarpus odorata;* cheerongee oil, from the seeds of *Buchanania latifolia;* chemmarum oil, from the seeds of *amoora rohituka;* Circassian-bean oil, from the seeds of *adenanthera pavonina;* hoorhoorya oil, from the seeds of *Polanisia icosandra;* custard apple-seed oil, from the seeds of *anona squamosa;* exile oil, from the seeds of *cerbera thevetia;* monela-grain oil, from the seeds of *dolichos uniflorus;* kanari oil, from the seeds of *Canarium commune;* khaliziri oil, from the seeds of *vernonia anthelmintica;* malkungunnee oil, from the seeds of *celastrus paniculatus;* bakul oil, from the seeds of *mimusops elengi;* rana oil, from the seeds of *mimusops kaki;* moodooga or pulas oil, from the seeds of *butea frondosa;* nahor or nageshur oil, from the seeds of *mesua ferox;* hone-seed oil, from seeds of *calophyllum calaba;* poonga, caron, or kurrmig oil, from the seeds of *pongamia-glabra;* vappanley oil, from seeds of *Wrightia antidysenterica;* babool oil, from seeds of *accasia Arabica;* gamboge oil, from seeds of the gamboge tree (*garcinia pictoria*); coodiri oil, from the seeds of *sterculia fœtida;* kikuel oil, from the seeds of *salvadorea persica;* marotty, surrate, or neeradimootoo oil, from the seeds of *hydnacarpus inebrians;* and pundi-kai oil, from the nutmegs of *myristica malabarica.*

From Brazil.—Oils from the seeds of *feuille cardifolia. F. monosperma, anisosperma passiflora, cucurbita citrullus, mabea fistuligera, anda gomesii, myristica bicuhiba, carpotroche Braziliensis, dipterix odorata, theobroma cacao, acrocomia sclerocarpa, nectandra cymbarum,* and from the fat of the alligator and the tapir, all for medicinal and perfumery purposes; and oils from the seeds of *œnocarpus bacába, Œ. pataud, caryoca Braziliensis,* and *Euterpe edulis,* used for culinary and lighting purposes.

From British Guiana.—Oil drawn from the stem of *oreodaphne opifera;* it resembles refined turpentine, and is suggested as a solvent for india-rubber. Wallaba oil, from the wood of the wallaba tree (*eperera falcata*), medicinal.

The preparation of the essential oils is treated of under PERFUMERY.

The importance of the manufacture of oils is very great; in 1880 the value of the imports of the leading staples of this trade—viz., fish, palm, cocoa, and olive oils—was no less than £3,444,599. The aggregate of the other kinds was £1,416,347. In addition, oil seeds to the value of about £5,500,000 are imported for crushing in Great Britain; whilst the exports of oil amount in value to about £1,600,000. Thus, it will be seen that this trade represents a capital of nearly £12,000,000 sterling. See OIL-WELLS and OIL-TRADE.

***OIL-WELLS AND OIL-TRADE.** One of the most remarkable trades, suddenly sprung up into importance in modern times, is that in oil obtained from subterranean sources. See NAPHTHA.

It is now known that oil-bearing mineral beds exist in various parts of America, as well as in the older continent; but the richest deposit hitherto discovered is in the United States, in Venango co., at a spot in Pennsylvania not far from the point of junction of that state and New York state with lake Erie. Oil had for many years been seen floating on the surface of the water of a well near Titusville; it was taken up by absorption by means of flannel, and applied to medicinal purposes. Dr. Brewer, in 1853, suggested that it might possibly be used for lubricating and for illumination; and in the following year was formed the Pennsyvania rock-oil company. This company languished until 1858, when col. Drake, manager of the company, and Mr. Bowditch, resolved to sink a well purposely for oil. They were amply rewarded, for oil was pumped up at a rate varying from 400 to 1000 gallons daily. The news being spread abroad, adventurers quickly came to the district, which obtained the names of Oil Creek and Petrolia; and they experienced every degree of fortune from utter failure to splendid success. By 1860 it was known that oil existed beneath 100 sq.m. of country, at a depth varying from 70 to 500 feet. In 1861 the first large *flowing* well was struck—that is, a well up which the oil rose so profusely as to flow over the surface, yielding 1000 barrels (of 40 gallans each) per day. "No mining enterprise had ever offered such sudden fortunes. A well costing

a few thousand dollars might yield from 100 to 2,000 barrels of oil daily with no expense for pumping. The Noble well yielded, in little more than one year, 500,000 barrels of oil. The Sherman flowed 450,000 barrels in about two years."

At first the uncertainty in this trade was something extraordinary. On one occasion a well was bored with the usual centerbit to a considerable depth without any oil being found. On withdrawing the bit, and putting in the rimer or rimmer to widen the hole, a vein was struck at the side. The bit had just missed the vein, and the well would have been a failure had not the orifice been enlarged. This incident gives meaning to a phrase much used in America—that of "striking oil." Another well was bored, flowing a large amount of oil; but by the time the owner had built tanks to collect it, the oil had altogether disappeared. The deepest well sunk in the district, more than 1000 ft., yielded no oil whatever; and altogether only 15 per cent of the borings were successful.

When the oil began to be sent in large quantities to New York and other towns, the cheapness of price led to its application as lamp oil, and in many other ways; the increasing demand brought the price up again to a reasonable figure at Petrolia, and the price induced the sinking of new wells. Small villages rose into large towns, with banks, hotels, and wealthy people, all, however, begrimed with oil. Titusville, which had 243 inhabitants in 1855, rose to nearly 9,000 in 1870. Oil city has now become a town of great importance. The new oil exchange is a handsome building, providing amply for the requirements of "the most important petroleum market in the world."

The following table shows the production of petroleum in 1870:

	Gallons.	Value in Dollars
Kentucky	4,000	650
Ohio	2,038,543	228,488
Pennsylvania	171,207,622	18,045,967
W. Virginia	8,013,340	1,029,119
Total	181,263,505	19,304,224

The production for the year ended June, 1878, had risen to the enormous figure of 619,000,000 gallons. The exports were about 66 per cent of the production, and were valued at $46,574,970. In 1876 it was estimated that 20,000 oil-wells had been dug in Pennsylvania and West Virginia, at a cost of $192,000,000. They have yielded oil to the value of $300,000,000 at the wells, or rather more than $400,000,000 at the sea-board. In 1880, about 420,000,000 gallons of mineral oil were exported from the U. S.

In Canada there are four areas in which oil-springs are found—two in Enniskillen, a third in Mosa and Oxford townships, and a fourth in Tilsonburgh. The Canadian oil is more troublesome to purify than that found in the States. Although it occurs abundantly, the production in 1878 was not more on the average than 1200 barrels per day. As explained under NAPHTHA, natural petroleums and the paraffin oils distilled from shale or coal very closely resemble each other, so that both kinds are used for the same purposes. In Scotland the paraffine-oil industry is an important one, yielding not much less than 30,000,000 gallons of crude oil annually, from which solid paraffin and other products are obtained as well as lamp oil. See SHALE. In Prussian Saxony the same or very similar products are distilled on nearly as large a scale from an earthly lignite found in the brown coal formation between Weissenfels and Zeitz. In Galicia, chiefly in the Boryslaw district, there are both a native oil and a native bitumen (ozokerite) found, which in 1873 yielded burning oil and paraffin to the value of nearly £500,000, and the industry is still prospering. There appears to be also a considerable supply of petroleum or rock-oil in Roumania.

In 1865 a shale was discovered in New South Wales, similar to the Boghead coal or Torbanehill mineral of Scotland, but richer in oil, and more free from sulphur. When distilled at Sydney, from 100 to 160 gallons of oil were obtained from one ton of shale. The seam in Hartley district is 5½ ft. thick. Of this substance the South Wales shale and oil company raised 15,598 tons in 1876, valued at £46,794; and there appears to be an extensive deposit of it in the district. These shale-oil industries are held in check by the low price at which American petroleum is usually sold; and in July, 1879, it was lower than it had ever been, namely 6½d. per gallon in the refined state in the London market. See *Supp.*, page 894.

OIRIR-GAEL, a name which, in the early times of Scottish history, was applied to the Gaels of the coasts, in contradistinction from the Gall-Gael or islesmen. There was long a struggle for superiority between these two races, represented respectively by Somerled of the isles and the later kings of Man, in which the latter were eventually successful, uniting under one head the dominion of Argyle and the Isles.

OISE, a river of France, one of the chief affluents of the Seine, rises in the vicinity of Rocroy, in the n. of the department of Ardennes, and flows s.w., joining the Seine at Conflans-Sainte-Honorine, after a course of 150 m., for the last 75 of which it is navigable. The fall of the river is very gradual, and its course is extremely sinuous. It is connected by canals with the Somme, the Sambre, and the Scheldt, and forms one of the chief commercial routes between Belgium and Paris. It becomes navigable at Chauny.

OISE, a department in the n. of France, is bounded on the e. by the department of Aisne, and on the w. chiefly by that of Seine-Inférieure, which intervenes between it and the English channel. Area, 2,250 sq.m., of which two-thirds are in arable land; pop. '81, 403,747. The principal rivers are the Oise—from which the department derives its name—and its tributaries the Aisne and Therain. The department is almost wholly included in the basin of the Oise; and as the course of that river indicates, the surface—consisting for the most part of extensive plains—has a general slope toward the s.w. The soil is in general fertile, and agriculture is well advanced. The products are the usual grain-crops, with an immense quantity of vegetables, which are sent to the markets of the metropolis. The department is divided into the four arrondissements of Beauvais, Clermont, Compiègne, Senlis; capital, Beauvais.

OITI, *Moquilea tomentosa*, a tree of the natural order *chrysobalanaceæ*—by many botanists regarded as a suborder of *rosaceæ* (q.v.)—a native of the n. of Brazil, and valuable on account of its timber, which is very good for ship-building.

OJE'DA, Alonso de, 1465–1510; b. Spain; came to America with Columbus in 1493. He conducted an exploring expedition through Santo Domingo, and a second one through the Vega Real. In 1499 he left Spain at the head of a new expedition, in which Amerigo Vespucci joined him. On this voyage he discovered Venezuela, which he named. In 1501 he again set sail from Spain with Vespucci, and this time he discovered the gulf of Uraba. He went back to Spain in 1508, and, having been granted the territory of Nueva Andalucia, the modern Colombia, he brought over a colony of 300, one of whom was Francisco Pizarro. He laid the foundations of a town called San Sebastian on the gulf of Darien, and, going to Hispaniola soon after for supplies and re-enforcements, was imprisoned by the owner of the ship in which he sailed. Transported to Cuba, he spent some years in fighting the Indians. He finally returned to Hispaniola exhausted by hardships, and soon died there.

OJIBWAYS, or Chippewas, a tribe of North American Indians of the Algonquin stock inhabiting the states of Michigan, Wisconsin, Minnesota, and the shores of lake Huron and lake Superior, with a rendezvous at La Pointe. They were discovered by the French about 1640, to which nation they were friendly, but continually at war with the Sioux. They were also allies of Pontiac, the great fighting chief of the Ottawas. When first discovered they were domiciled at Sault Ste. Marie, deriving the name of *Sauteur* from that place, by which they are still known to the Canadians. They have the customs of the Algonquins; they are brave and never knew defeat in their wars with the Foxes, Sioux, or Iroquois, their constant enemies. War had thinned their ranks, and in 1660 there were only 550 at the Sault. During the revolutionary war they were on the side of the British, but came over to the side of the colonists in 1785–89, turned against them subsequently and joined the Miamis, but again made peace in 1795. In 1805 they gave up nearly all their possessions as far e. as lake Erie. In the war of 1812 they were hostile, but in 1816 participated in the general treaty of the tribes, and in 1817 gave up all their lands in Ohio. In 1851 all but a few roving bands had been removed w. of the Mississippi and had ceded all their lands to the government except small reservations. The bands living near lake Superior and in Michigan are generally peaceable and industrious. Those w. of the Mississippi still have extensive tracts of land, amounting to more than 5,000,000 acres as established by treaties 1854–67. In 1872 the government owed them $750,000. In 1884 there were a few of this tribe in Canada, 9,500 in Michigan, 2,138 in Minnesota, and 3,592 in Wisconsin, and a small number living in other states. Where Protestant and Roman Catholic churches and schools have been established, they are well attended and with encouraging results, but there are still some who maintain belief in Kitchie Manitou, the great or good spirit, and Matchie Manitou, the evil spirit. Their priests are called medas. The principal occupation is making mats, and hunting and fishing; but many are cultivating farms with success. They speak the language of the Algonquins which is found in Eliot's Indian Bible, but in their use it is so intermixed with others that few original dialect forms remain. There are a dictionary and grammars by bishop Baraga and the rev. G. A. Belcourt, and treatises by Schoolcraft and others. A newspaper is printed in their language; and in 1851 George Copway, a native Ojibway wrote a *Traditional History of the Ojibway Nation*, and in 1861 Peter Jones of the same tribe was the author of a *History of the Oijbway Indians*.

O'KA, an important commercial river of central Russia, the principal affluent of the Volga from the s., rises in the government of Orel, and flows in a generally n.e. direction, forming a common boundary between the governments of Tula, Kaluga, and Moscow; and afterwards flowing through the governments of Riazan, Vladimir, and Nijni-Novgorod. It joins the Volga at the city of Nijni-Novgorod, after a course of 837 miles. Its basin, estimated at 127,000 sq.m. in extent, comprises the richest and most fertile region of Russia. The principal towns on its banks are Orel, Beleff or Bielev, Kaluga, Riazan, and Murom; the most important affluents are the rivers Moscow, Kliasma, and Tzna. During spring, the Oka is navigable from Orel to the Volga; but in summer the navigation is obstructed by sand-banks. It communicates with the ports on the Baltic, Caspian, and White seas; and the cargoes annually shipped down the river amount in value to several million pounds sterling.

OKANA'GANS, an Indian tribe, belonging to the Shushwap division of the Selish family, and living about the Okanagan river in Washington territory. They are semi-civilized, and have made some advances in agriculture. Their number is about 300.

O-KEE-CHO'-BEE, a lake bordering on the Everglades of southern Florida (see FLORIDA), about 120 m. in circuit, receiving several small rivers, and having for its outlet the river Caloo-sa-hatchee, which flows westerly into the gulf of Mexico.

OKEECHO'BEE, LAKE (*ante*), s. of Brevard co., Fla., between Manatee co. and the Everglades; is about 35 m. in its greatest and 25 m. in the shortest diameter; about 1200 sq.m.; there are many inlets, of which the Kissimee river is the largest; the waters are drained off into the Everglades, but there is no outlet of any size. The region about is wild and made up of swamp and jungle. Alligators and poisonous snakes abound. There are a few small islands in the lake, on which it was formerly believed that there were ancient ruins, but this report is now discredited.

O'KEEFE, JOHN, 1747–1833; b. Ireland; began to study painting when six years old with West, of the Royal Irish academy. At 16 he wrote a comedy, and at 18 a play of his was produced at Dublin. Soon after he joined a theatrical company, and wrote a number of small pieces, in which he appeared at his own benefits. His *Tony Lumpkin in Town* was produced at the Haymarket, London, in 1778, and gained for its author an English reputation. He settled in London, and though threatened with blindness, continued to write for the stage. His dramatic pieces number 68, and of these 56 were played on the stage; and some of them, such as the operatic farces, *The Highland Reel*, and *The Agreeable Surprise*, and the farce *Wild Oats*, are still seen on the stage. He stopped writing in 1798, when he had become almost totally blind. For some years afterward he was in straitened circumstances, till he was relieved by a pension from the crown. He published in 1826 *Recollections of the Life of John O'Keefe, written by Himself.* A collection of his pieces in verse was published in 1834 under the title of *O'Keefe's Legacy to his Daughter.* He was himself a Roman Catholic, but his son became a clergyman in the English church. His works are deficient in characterization and incident, and rough in diction, but full of broad humor and rollicking spirits.

OKEFINO'KEE SWAMP, in Baker co., Florida, and Ware, Clinch, and Charlton counties, Ga. It covers an immense region, comprising many great forests and lakes.

O'KELLY, JAMES, 1757–1826; of Irish birth; a noted pioneer preacher in the Methodist Episcopal church, and the leader in the first secession from it. He became a local preacher, and the people flocked to hear him. In 1778 he was admitted among the traveling ministers, and soon became prominent for earnestness and fervor. At the organization of the church in 1784 he was ordained as an elder. One of his contemporaries speaks of him as "laborious, zealous, given to prayer and fasting, ... and hard against negro slavery in private and from the pulpit and press." His labors and influence were confined chiefly to the southern counties of Virginia and the border counties of North Carolina. In 1790 he began to show dislike to what he thought the growing power of bishop Asbury, and called on him privately to suspend his episcopal functions for one year, if he did not wish to be publicly opposed. As this menace produced no effect he made the movement in the conference of 1791 that resulted in the withdrawal of himself and a few others from the church. At first they called themselves the republican Methodists, but afterwards changed their name to the Christian church. This company was soon divided and subdivided until only a few broken societies remained. O'Kelly lived many years, witnessing through them the failure of his plans. He saw his followers forsaking him and returning to the church which they had left. But he clung to his convictions to the last. See METHODIST EPISCOPAL CHURCH, DIVISIONS IN.

OKEN (originally OCKENFUSS), LORENZ, a celebrated German naturalist, was b. at Bohlsbach, in Würtemberg, Aug. 1, 1779. He studied at Würzburg and Göttingen; became extraordinary professor of medicine at Jena in 1807, where his lectures on natural philosophy, natural history, zoology, comparative anatomy, vegetable and animal physiology, attracted much notice. In 1812 he was appointed ordinary professor of natural science; and in 1816 commenced the publication of a journal partly scientific and partly political, called *Iris*, which continued to appear till 1848. The opinions promulgated in the *Iris* led to government interference, and Oken resigned his chair, and became a private tutor, devoting his leisure to the composition of works on natural history. In 1828 he obtained a professorship in the newly-established university of Munich, but in 1832 exchanged it for another at Zürich, where he died, Aug. 11, 1851. Oken aimed at constructing all knowledge *à priori*, and thus setting forth the system of nature in its universal relations. The two principal works in which this idea is developed are his *Lehrbuch der Naturphilosophie* (Jena, 1808–11), and his *Lehrbuch der Naturgeschichte* (3 vols. Leip. 1813–27). The former has been translated into English, and published by the Ray society under the title of *Elements of Physio-philosophy.* As Oken's philosophic system of nature was very peculiar, and quite unlike anything that had preceded it, Oken invented a nomenclature of his own, which, however, in many cases is forced and pretentious, composed for the most part of new-coined words, and difficult to remember. It therefore found little favor, and Oken was long regarded—particularly by French and English savans—as a mere dreamer and transcendental theorist; nor can

it be denied that he is largely such, infected with the worst vices of the school of Schelling, to which he belonged; but some of his "intuitions"—if we may so term his scientific suggestions—were remarkably felicitous, and in the hands of rigorous demonstrators, have led to great results. In his work *Die Zeugung* (On Generation, Bamb. 1805), he first suggested that all animals are built of vesicles or cells; in his *Beitrage zur vergleichenden Zoologie, Anatomie und Physiologie* (1806), he pointed out the origin of the intestines in the umbilical vesicle; and in the same year lighted accidentally upon the idea, since so prolific of results, that the bones of the skull are modified vertebræ. On account of this discovery he has been termed "the father of morphological science." That Oken, and not Göthe, was the original discoverer of the vertebral relations of the skull, has been conclusively shown by Owen, in a valuable notice of Oken in the *Encyclopædia Britannica.*

OKHO'TSK, Sea of, an extensive inlet of the n. Pacific ocean, on the e. coast of Russian Siberia. It is bounded on the n. by the wastes of Siberia, on the e. by the peninsula of Kamtchatka, and is partially inclosed by the Kurile islands on the s., and by the island of Saghalien on the west. It is 1000 m. in length, and 500 m. in breadth. The river Ud, which enters it on the n., is 400 m. in length. Owing to climate and position the sea of Okhotsk is unlikely ever to become the scene of much commerce. On its northern shore, at the mouth of the Okhota—from which it derives its name—is the small seaport of Okhotsk, lat. 57° 21′ n., long. 143° 17′ east. This town has only 236 inhabitants, and has been entirely superseded by the ports of Ayan and Nikolayevsk.

OKLAHOMA. See page 895.

OKRA, or Ochro. See Hibiscus, *ante.*

OKTIBBEHA, a co. in n.e. central Mississippi, watered by the Noxubee and Oktibbeha rivers, traversed by a branch of the Mobile and Ohio railroad; about 500 sq. m.; pop. '80, 15,977—10,870 colored. The surface is level, and heavily wooded. The soil is fertile. The principal productions are corn, cotton, and pork. Co. seat, Starkville.

OKUBO, Toshimichi, a Japanese statesman, b. in the province of Satsuma about 1830. As a member of the proudest of the Japanese clans, he was nurtured in the traditions of exclusivism and undying jealousy of and hatred towards the tycoons of Yedo. His sympathies were early enlisted in that literary movement, whose goal was the restoration of the ancient undivided power of the mikado. Going to Kioto he cultivated the friendship of those court nobles possessed of political capacity, and those patriotic students, who with himself finally overthrew the dual system of government. At the bombardment of Kagoshimi by the British fleet in 1864, he served in one of the batteries as a defender of the city. In 1868, having pushed forward the secret plans of the revolutionary coalition at Kioto, he precipitated the crisis of six hundred years, and stepped into the front rank of leaders in the new government. He urged the unfurling of the mikado's brocade banner which stamped the tycoon as a traitor. He startled even the new government by urging the removal of the capital from Kioto to Yedo, the abandonment of the habits of excessive reverence to the sovereign, and his entrance into public life as the active ruler of his people. Such was the lively effect of Okubo's memorial, that within one month the mikado publicly took the oath on which the government of New Japan is built. The national capital was changed to Yedo, now called Tokio. Okubo thenceforward represented in his own person the foreign influences which have shaped the course of Japan since 1868. His name is imperishably associated with the long list of reforms which have changed the insular empire from an agglomeration of feudal principalities to a compact modern state. Of all Japanese statesmen he was the least distinctly Japanese. A stong dash of the Caucasian in his character eminently fitted him to be the interpreter of foreign ideas to the mikado's court. In personal appearance his tall, arrowy form and luxuriant side whiskers gave him the appearance of a European rather than an Asiatic. He visited America with the embassy in 1872, and on his return was made minister of the interior. When the Saga rebellion broke out in 1873 he went in person on the battle-fields, and sat at the tribunals that condemned the insurgents to death. When the Japanese army landed in Formosa in 1874, to chastise the cannibals, and the Chinese demanded their withdrawal, Okubo was sent by the mikado to Pekin to present the ultimatum of Japan. The Chinese paid the indemnity demanded of 700,000 taels, and agreed to police the coasts of aboriginal Formosa. He was president of the Japanese commission to the centennial exposition at Philadelphia, but did not visit America. On the night of May 13, 1878, having been warned of his impending assassination (by fanatics who hated his progressive policy) he expressed before a party of friends his belief in the decree of heaven that would protect him if his work were not yet done; but which, otherwise, would permit his death, even though he were surrounded by soldiers. On May 14, while on his way to the mikado's palace unarmed, he was murdered by six assassins, who were said to have been runaways from the Satsuma rebellion, put down only a few months before. The mikado immediately conferred upon his dead servant the highest rank, and elevated his sons to the nobility. In the funeral cortege, probably the most imposing ever seen in Tokio, rode the highest nobles, officials, and foreign diplomats. Okubo was unquestionably one of the ablest men Japan ever produced.

OKUMA SHIGE'NOBU, a Japanese statesmen b. in the province of Hizen in 1837. He was among the number of progressive young men who early studied the Dutch language and sciences, going to Nagasaki for that purpose; whence he was called to Tokio, to a post in the foreign office. He was transferred to the finance department in 1869. There his conspicuous abilities brought him to the notice of the mikado, who created him a Sangi or imperial counselor. In 1871 he was made president of the commissioners to the Vienna exposition. The ability displayed by Mr. Okuma Shigenobu in handling the finances of an Asiatic nation while in a transitional condition from mediæval feudalism to modern forms of government, and through all the perplexities incident to not less than four great insurrections, have been acknowledged by many competent foreign observers. Under his administration the hereditary incomes of the samusai or gentry have been capitalized; an internal revenue and national banking system, based on those of the United States, have been established; the local paper money issues of the daimios replaced by national currency; loans raised, and the national credit maintained in Europe and at home. Shigenobu was, in 1880, a leading member of the Japanese cabinet.

OLAF, the saint, one of the most revered of the early Norwegian kings, was born in 995; and after having distinguished himself by his gallant exploits, and made his name a terror in several warlike expeditions on the coasts of Normandy and England, succeeded, in 1015, in wresting the throne of Norway from Eric and Svend Jarl. The cruel severity with which he endeavored to exterminate paganism by fire and sword, alienated the affection of his subjects, many of whom sought security from his persecution in the territories of Knut or Canute the great, king of Denmark; and it was only through the powerful aid of his brother-in-law, the Swedish Anund Jacob, that his authority could be upheld. Olaf's hot-headed zeal, however, after a time exhausted the patience of the people, who hastened to tender their allegiance to Knut, on his landing in Norway in 1028, when Olaf fled to the court of his brother-in-law, Jaroslav of Russia, who gave him a band of 4,000 men, at the head of whom he returned in 1030, and gave Knut battle at Stiklestad, where Olaf was defeated by the aid of his own subjects, and slain. The body of the king, which had been left on the field of battle, and buried on the spot by a peasant, having begun to work miracles, his remains were carefully removed to the cathedral of Trondhjem, where the fame of their miraculous power spread far and wide, attracting pilgrims from all parts of the Scandinavian peninsula. Olaf was solemnly proclaimed patron saint of Norway in the succeeding century; and from that period till the reformation he continued to gather round him a rich heritage of mythical legends and popular sagas, the memory of which still lingers in the folk-lore of Norway. In 1847 the order of Olaf was created, in honor of the saint, by king Oscar I. of Sweden and Norway.

ÖLAND. See ŒLAND, *ante.*

OLBERS, HEINRICH WILHELM MATHIAS, a celebrated German physician and astronomer, was born at Arbergen, a small village of Bremen, Oct. 11, 1758. He studied medicine at Göttingen from 1777 till 1780, and subsequently commenced to practice at Bremen, where, both as a physician and as a man, he was highly esteemed by his fellow-citizens. In 1811 he was a successful competitor for the prize proposed by Napoleon for the best "Memoir on the Croup." Olbers wrote little on medical subjects, for, from 1779, all the leisure time which he could abstract from professional occupations was devoted to the enthusiastic study of astronomy. The first thing which brought him into notice was his calculation of the orbit of the comet of 1779, which was performed by him while watching by the bedside of a sick patient, and was found to be very accurate. Comets were the chief objects of his investigation, and he seems to have been seized with an irresistible predilection for these vagabonds of the solar system, which his two important discoveries of the planets Pallas (1802) and Vesta (1807) could not diminish. In 1781 he had the honor of first re-discovering the planet Uranus, which had previously been supposed, even by Herschel himself, to be a comet, and which had been sought for in vain. He also discovered five comets, in 1798, 1802, 1804, 1815, and 1821, all of which, with the exception of that of 1815 (hence called *Olbers's comet*), had been some days previously observed at Paris. His observations, calculations, and notices of various comets, which are of inestimable value to astronomers, were published in the *Annuaire of Bode* (1782–1829), in the *Annuaire of Encke* (1832), and in three collections by the baron de Zach. Most of these calculations were made after a new method, discovered by himself, for determining the orbit of a comet from three observations; a method which, for facility and accuracy, he considered as greatly preferable to those then in use. A detail of it appeared in a journal published at Weimar (1797), and a new edition by Encke in 1847. Olbers was one of that small band of astronomers which included also Schröter, Gauss Piazzi, Bode, Harding, etc., who in the first ten years of the 19th c. devoted their energies to the observation of those planets which were coming to light between Mars and Jupiter. As above stated, two of them, the second and fourth in order of discovery, were detected by Olbers himself; and the general equality of the elements of the four planetoids led him to propound the well-known theory, that these, and the other planetoids (q.v.) since discovered, are but fragments of some large planet which formerly revolved round the sun at a distance equal to the mean of the distances of the planetoids

from the same luminary. It was this theory which led him, after the discovery of Pallas, to seek for more fragments of the supposed planet, a search resulting in the discovery of Vesta. Olbers also made some important researches on the probable lunar origin of meteoric stones, and invented a method for calculating the velocity of falling stars. Olbers died at Bremen, Mar. 2, 1840; and in 1850 his fellow-citizens erected a marble statue in honor of him. Olbers, as a writer, possessed great powers of thought, combined with equal clearness and elegance of expression. The dissertations with which he enriched the various branches of astronomy are scattered through various collections, journals, and other periodicals.

OLDBURY, an important manufacturing t. of England, in the county of Worcester, 29 m. n.n.e. of the city of that name, on the river Teme. It contains numerous churches, meeting-houses, and schools. Owing to the extension of the iron trade, Oldbury has greatly increased in size and prosperity within recent years. There are coal and iron mines in the neighborhood; and in the town iron, steel, locomotive engines, mills, edge tools, draining-pipes, etc., are made and constructed. The Stour Valley railway passes close by the town, and there is a station here. Pop. '80, 18,821.

OLDCASTLE, Sir JOHN, once popularly known as the "good lord Cobham," whose claim to distinction is that he was the first author and the first martyr among the English nobility, was born in the reign of Edward III.; the exact year is not known. He acquired the title of lord Cobham by marriage, and signalized himself by the ardor of his attachment to the doctrines of Wycliffe. At that time there was a party among the English nobles and gentry sincerely, and even strongly desirous of ecclesiastical reform —the leader of which was "old John of Gaunt—time-honored Lancaster." Oldcastle was active in the same cause, and took part in the presentation of a remonstrance to the English commons on the subject of the corruptions of the church. At his own expense he got the works of Wycliffe transcribed, and widely disseminated among the people, and paid a large body of preachers to propagate the views of the reformer throughout the country. During the reign of Henry IV. he commanded an English army in France, and forced the duke of Orleans to raise the siege of Paris; but in the reign of Henry V. he was accused of heresy, and having, in a disputation with his sovereign, declared that "as sure as God's word is true, the pope is the great Antichrist foretold in Holy Writ," he was thrown into the Tower, whence, after some time, he escaped, and concealed himself in Wales. A bill of attainder was passed against him, and 1000 marks set upon his head. After four years' hiding he was captured, brought to London, and—being reckoned a traitor as well as a heretic—he was hung up in chains alive upon a gallows, and fire being put under him, was burned to death, Dec., 1417. Oldcastle wrote *Twelve Conclusions addressed to the Parliament of England,* several monkish rhymes against "fleshlye livers" among the clergy, religious discourses, etc.—See *Life of Oldcastle,* by Gilpin.

OLD CATHOLICS, those members of the Roman Catholic church in Germany who, in 1870, took the ground that the dogma of the immaculate conception of 1854, the encyclical and syllabus of 1864, and the decree of papal infallibility had so changed the status of the Roman church that no man could continue in its communion and still adhere to the Catholic church of Christ. They disputed the œcumenical character of the Vatican council, and, although the promoters of the movement included *before* the promulgation of the decree the German and Austrian bishops who had entered a united protest against it, the bishops withdrew and submitted *after* its proclamation, July 8, 1870. A large number of German theologians and civilians, however, denounced the course of the bishops, and prof. Michælis openly charged the pope with heresy and apostasy. This was followed by a formal declaration and protest by Dr. Döllinger and 43 other professors of the university of Munich against papal infallibility and the validity of the Vatican decrees. A conference was held at Nuremberg, Aug., 1870, which, though purely consultative, drew up a united protest against the œcumenical character of the vatican council, and the binding authority of its acts. Prominent among the signers appeared the weighty names of Döllinger, Friedrich, Schulte, Michælis, and Lutterbeck.

This formal protest induced the bishops forthwith to initiate repressive measures. In a pastoral, Sept. 10, they sounded the alarm and warned all true Catholics to submit; and when it became evident that the movement had not become popular with the clergy and laity, they went further in depriving the protesting theologians of their functions, excommunicated them, and forbade students to frequent their lectures. With the exception of a few lukewarm, timid adherents, the great body of the reformers remained firm in their convictions. Döllinger, in a letter to his diocesan, dated Mar. 28, 1871, declared that, "as a Christian, as a theologian, as an historian, and as a citizen," he could not accept the new dogma. He was excommunicated for it April 17, 1871. His excommunication became the starting point of revived energy throughout Germany. In a formal declaration of principles the promoters of the movement said: "Faithful to the inviolable duty of every catholic Christian, which is also a thing not denied by pope or bishop, to hold fast by the ancient faith, and to reject innovations, even if proclaimed by an angel from heaven, we persist in the rejection of the Vatican dogma." The first old Catholic congress met at Munich, Sept. 22, 1871. It was attended by about 300 delegates from Germany, Austria, and Switzerland, and friends from Holland, France, Russia, England, and elsewhere. In the resolutions adopted the body defined its theological

status, and said with regard to its relations to other members of the Catholic church: "We declare that the reproach of Jansenism against the Utrecht church is causeless; there is no dogmatic difference between her and ourselves. We hope for reunion with the oriental Greek and with the Russian churches, whose separation was without absolute cause, and is based on no irreconcilable dogmatic difference. We expect, in the assumption of the reforms which we attempt, and in the way of science, and of progressing Christian knowledge, a gradual understanding with the Protestant and Episcopal churches." The disposition of Döllinger to stave off a complete ecclesiastical organization had to yield to the predominant opposite feeling. Meanwhile the old Catholic congregations were without episcopal supervision and ministrations, and the Bavarian congregations secured the friendly offices of the archbishop of Utrecht in the administration of confirmation. When the second old Catholic congress met at Cologne, Sept., 1872, the work of organization made progress. The church was to depend for episcopal functions temporarily on the bishops of the old Catholic church of Holland, and of the United Armenian church, whose attitude to Rome was analogous with their own. A commission was appointed to take order for the election of a bishop by the clergy and laity. Intercommunion with the Eastern and Anglican churches was sought to be established. The claim to recognition by the state, with a share of the church property, was asserted. In the following year (June 4, 1873) Dr. Joseph Hubert Reinkens, professor of theology in the university of Breslau, was elected missionary bishop for Germany, and consecrated Aug. 11, at Rotterdam, by the bishop of Deventer. The third Old Catholic congress was held Sept. 12–14 at Constance, whose crowning act was the adoption of a synodal constitution, which provides for diocesan, provincial, and general synods, composed of clerical and lay delegates, the latter on the basis of one delegate for every 200 constituents. The first synod, at Bonn, May 27, 1874, was attended by 28 clerical and 60 lay delegates. In the direction of reform its action was marked by conservative caution; confession, fasting and abstinence, and priestly celibacy were retained, the prevailing sentiment being the correction of Roman abuses and corruptions to the purer practice of the early church. The obnoxious features of so-called mixed marriages, i.e., marriages between Roman Catholics and Protestants, were set aside; the drafting of a new ritual and catechism was assigned to committees; a synodal representation or standing committee was appointed. The church at that time reported the existence throughout Germany of 132 parishes and societies, numbering about 25,000 souls, 41 priests, and 12 theological students. The 4th congress, at Freiburg, in Baden, Sept. 5—9, 1874, took action to establish an equitable legal status of the Old Catholic church in Germany, and a *pro rata* share of the church property. The congress was followed by a conference aiming at church unity, at Bonn, Sept. 14–16, 1874, at which Dr. Döllinger presided, and in which, besides old Catholics, Easterns and Anglicans participated. It was unanimously agreed that the insertion of the words *filioque* in the Nicene creed was unlawful, and that it was very desirable to have them expunged by the concurrent action of the different churches. Other points of agreement amongst Old Catholics, Anglicans, and orientals were also discussed; e.g., the place of the Apocrypha in the canon; the relation of versions of the Bible to the original text; the proper language (a dead one or the vernacular) for the conduct of divine service; the doctrines of supererogation and indulgences, and of the immaculate conception. The prevailing sentiment on these and kindred themes was decidedly anti-papal, and agreement on them was regarded as a possible basis for the unification of Christendom. See DÖLLINGER, JOHN J. I. VON.

The 5th Old Catholic congress was at Breslau, Silesia, Sept. 22–24, 1876, thinly attended, in part on account of the great distance of that city from the centers of the Old Catholic movement, and in part also on account of waning interest. The latter circumstance holds good also concerning the 6th congress, held Sept., 1878, at Mayence, of which no official report has been published. There is doubtless great disappointment in the comparatively slow progress of the movement, which has failed to enlist popular enthusiasm, but the tide seems to have set in the direction of greater growth and revived energy, as will be seen from a subsequent paragraph.

The national church of Holland, generally but erroneously styled Jansenist, has heartily entered into the Old Catholic movement, and may be regarded as occupying identical ground.

The relation of the Old Catholic church of Germany to the Anglican communion is very friendly. Representatives of the church of England and the Protestant Episcopal church in the United States have been present at most of their congresses, and several of their synods; and the Anglican communion may be said to be in cordial sympathy with the Old Catholics. The presence of bishop Herzog at the general convention (Prot. Epis.) held at New York, Oct., 1880, has tended to strengthen that feeling (see below).

In Switzerland the old Catholic reform had a more pronounced effect on the people than in Germany. At Geneva it carried with it the majority of the Roman Catholics of the city. The cantonal government, moreover, aided it by speedy recognition. An old Catholic conference, held at Olten, Aug. 31, 1873, resolved upon drafting a constitution for a Swiss national church, and electing a bishop or bishops. At a like conference at the same place, Sept. 21, 1874, a constitution was adopted which provides for a national synod of "the Christian Catholic church of Switzerland," by which the Swiss Old Catholics are now known. Pastor Herzog of Olten was subsequently chosen and consecrated

bishop. The statistics of the church, presented to the synod in 1877, were: 66 parishes and 70 priests; baptisms for the year, 1182; number of persons confirmed, 3,098.

In Austria the Old Catholic movement has been very slow. There are several congregations in Bohemia, and under the influence of recent political changes the first lawfully authorized Old Catholic synod of Austria was held at Vienna, June 29, 1880, which adopted synodal and parochial regulations, and decreed the use of the language of the people in divine service.

In Russia, in the province of Volhynia, are also several Bohemian communities attached to the Old Catholic church, served by three priests, recognized and supported by the state, who were, in Dec., 1879, taking steps looking towards the formation of a synodal council.

At the Swiss Christian Catholic synod, at Geneva, May 20, 1880, bishop Herzog reported that owing to peculiar state complications the church had lost in the canton of Bern 12 parishes and 10 priests; but that they numbered throughout Switzerland 59 priests in 48 established parishes. At this synod a prayer-book, framed after an Anglican model, was authoritatively set forth for present use. The executive council of Switzerland has issued a decree defining the right of possession of churches, to wit, that the majority in a parish, be they Roman or Old Catholic, are invested with the ownership, but that the minority are also entitled to worship in them without paying an indemnity.

The 7th Old Catholic congress, at Baden-Baden, Sept. 12–14, 1880, was attended by 150 delegates, at which bishop Reinkens reported favorably of progress in Germany, in which now are somewhat less than 50,000 adherents. The congress resolved unanimously upon the universal use of the German liturgy in public worship, and adopted a number of theses, which accurately describe the present attitude of the Old Catholics towards the Latin church.

1. It is impossible that there should be a real contradiction between belief, based on historical testimony, of the fundamental truths of Christianity, and science, based on the absolute facts of nature and mind. They mutually protect, aid, and complete each other. 2. The independence of national churches accords as much with the universal character of the church as national peculiarities in the state, in art, and in science accord with the general objects of culture. 3. It is an unfortunate error of many Protestants to regard that church, which the adherents of the vatican are bound to acknowledge as alone saving, as a shield of faith, a prop of authority to the state or society, and a bulwark against destructive social tendencies; and to receive its adherents as conservative allies. 4. History, the task and duty of self-preservation compel the German empire to oppose the vatican system. 5. Negotiations with the infallible pope, or his organs, on all matters belonging to the legislative functions and the authority of the state should be repudiated. All such transactions conduce to the dissolution of the national state.

Ground, somewhat similar to that occupied by the Old Catholics, is held by the *Armènian* church, which, since 1867, felt greatly aggrieved by the course of the pope, who, in his bull *Reversurus*, changed the manner of choosing their patriarchs and bishops. The third vatican decree, declaring the pope's universal episcopate, was especially distasteful to them. In Oct., 1870, they declared that while they had not fully decided as to the vatican council, whose decrees many had refused to accept, who yet remained Catholics, they would not receive any decree which set aside that of Florence. In Nov., 1871, the pope excommunicated those of them who would not yield. They deposed their patriarch, and elected in his place Kiepeliau, archbishop of Diarbekir. They have since been put in possession, by the Turkish government, of many of the united Armenian churches.

In France, M. Hyacinthe-Loyson may be regarded as generally representing Old Catholic views. His aim is the reformation of the Roman Catholic church in that country on the basis and principles of the old Gallican church.

OLDENBURG, a grand-duchy of northern Germany, consisting of three distinct and widely separated territories, viz., Oldenburg proper, the principality of Lübeck, and the principality of Birkenfeld. The collective area of these districts is now 2,461 square miles. Pop. in 1880, 337,478. Oldenburg proper, which comprises seven-eighths of this area, and four-fifths of the entire population, is bounded on the n. by the German ocean, e., s., and w. by the kingdom of Hanover. The principal rivers of Oldenburg are the Weser, the Jahde, and the Haase, Vehne, and other tributaries of the Ems. The grand-duchy of Oldenburg proper is divided into 8 circles. The country is flat, belonging to the great sandy plain of northern Germany, and consists for the most part of moors, heaths, marsh or fens, and uncultivated sandy tracts; but here and there, on the banks of the rivers, the uniform level is broken by gentle acclivities, covered with wood, or by picturesque lakes surrounded by fruitful pasture-lands. Agriculture and the rearing of cattle constitute the chief sources of wealth. The horses and cattle raised in the marsh lands are excellent of their kind, and in great request; the horse-markets at Oldenburg, and the cattle sales at Ovelgönne, being frequented by purchasers from every part of Germany. The scarcity of wood for fuel, and the absence of coal, are compensated for by the existence of turf-beds of enormous extent. With the exception of some linen and stocking looms, and a few tobacco works, there are no manufactories. There

are, however, numerous distilleries, breweries, and tan-yards in all parts of the duchy.

The trade is principally a coasting trade. carried on in small vessels, from 20 to 40 tons, which can thread their way along the shallow channels connecting the larger rivers.

The exports are horses, cattle, linens, thread, hides, and rags, which find their way chiefly to Holland and the Hanseatic cities; while the imports include the ordinary colonial goods, and manufactures of numerous kinds.

The receipts for the collective grand-duchy were, in the budget for 1883, £309,799, and the expenditure, £323,726. The public debt, at the close of 1883, was £1,850,476.

The principality of Lübeck, consisting of the secularized territories of the former bishopric of the same name, is surrounded by the duchy of Holstein, and is situated on the banks of the rivers Schwartau and Trave. It contributes 199 sq.m. to the general area of the grand-duchy, and 34,085 inhabitants to the collective population. It is divided into four administrative districts. It has several large lakes, as those of Plön—noted for its picturesque beauty—Keller, Uklei, and Gross-Eutin; while in regard to climate, soil, and natural products, it participates in the general physical chrracteristics of Holstein. The chief town is Eutin (pop. in 1871, 3,700), pleasantly situated on the lake of the same name, with a fine castle surrounded by a magnificent park.

The principality of Birkenfeld, lying s.w. of the Rhine, among the Hundsrück mountains, and between Rhenish Prussia and Lichtenberg, is an outlying territory, situated in lat. 49° 30′—49° 52′ n., and in long. 7°—7° 30′ e. Its area is 192 sq.m., and its pop. 37,093. The soil of Birkenfeld is not generally productive; but in the lower and more sheltered valleys, it yields wheat, flax, and hemp. Wood is abundant. The mineral products, which are of considerable importance, comprise iron, copper, lead, coal, and building-stone; while in addition to the rearing of cattle, sheep and swine, the polishing of stones, more especially agates, constitutes the principal source of industry. The principality is divided into three governmental districts.

Oldenburg is a constitutional ducal monarchy, hereditary in the male line of the reigning family. The constitution, which is based upon that of 1849, revised in 1852, is common to the three provinces, which are represented in one joint chamber, composed of 33 members, chosen by free voters. Each principality has, however, its special provincial council, the members of which are likewise elected by votes; while each governmental district within the provinces has its local board of councilors, and its several courts of law, police, finance, etc.; although the highest judicial court of appeal, and the ecclesiastical and ministerial offices, are located at Oldenburg.

Perfect liberty of conscience was guaranteed by the constitution of 1849. The Lutheran is the predominant church, upwards of 200,000 of the population belonging to that denomination; while about 70,000 persons profess the Roman Catholic religion.

There are two gymnasia, one higher provincial college, several secondary, and 500 elementary schools; but in consequence of the scarcity of villages in the duchy, and the isolated position of many of the houses of the peasantry, schools are not common in the country districts, and the standard of education of the lower classes is, from these causes, scarcely equal to that existing in other parts of northern Germany. The military forces of Oldenburg—above 2,000 men on the peace footing—form a portion of the Prussian army. The merchant navy in 1875 consisted of 361 vessels of 53,167 tons. Oldenburg is represented in the bundesrath or federal council of the German empire by one member, and in the reichstag or diet by 3 members.

History.—The territory now included in the grand-duchy of Oldenburg, was in ancient times occupied by the Teutonic race of the Chauci, who were subsequently merged with the more generally known Frisii, or Frisians; and the land, under the names of Ammergau and Lerigau, was for a long period included among the dominions of the dukes of Saxony. In 1180, the counts of Oldenburg and Delmenhorst sueceeded in establishing independent states from the territories of Henry the Lion, which fell into a condition of disorganization after his downfall.

This family has continued to rule Oldenburg to the present day, giving, moreover, new dynasties to the kingdom of Denmark, the empire of Russia, and the kingdom of Sweden. See OLDENBURG, HOUSE OF. On the death, in 1667, of count Anthony Gunther, the wisest and best of the Oldenburg rulers, his dominions, in default of nearer heirs, fell to the Danish reigning family, and continued for a century to be ruled by viceroys nominated by the kings of Denmark. This union was, however, severed in 1773, when, by a family compact, Christian VII. made over his Oldenburg territories to the grand-duke Paul of Russia, who represented the Holstein-Gottorp branch of the family. Paul having renounced the joint countships of Delmenhorst and Oldenburg in favor of his cousin, Frederick Augustus, of the younger or Kiel line, of the House of Oldenburg, who was prince-bishop of Lübeck, the emperor raised the united Oldenburg territories to the rank of a duchy. The present reigning family is descended from duke Peter Friedrick Ludwig, cousin to the prince-bishop, Frederick Augustus. For a time the duke was a member of Napolcon's Rhenish confederation; but French troops having, in spite of this bond of alliance, taken forcible possession of the duchy in 1811, and incorporated it with the French empire, the ejected prince joined the ranks of the allies. In recognition of this adhesion, the congress of Vienna transferred certain portions of

territory, with 5,000 Hanoverians and 20,000 inhabitants of the quondam French district of the Saar, to the Oldenburg allegiance. From these new acquisitions were organized the district Amme, and the principality of Birkenfeld; while Oldenburg was raised to the dignity of a grand-duchy. The revolutionary movement of 1848 was quite as productive of violent and compulsory political changes in this as in other German states; and in 1849, after having existed for centuries without even a show of constitutional or legislative freedom, it entered suddenly into possession of the most extreme of liberal constitutions. The reaction in favor of absolutism, which the license and want of purpose of the popular party naturally induced all over Germany. led in 1852 to a revision and modification of the constitution, which, however, in its present form, contains the essential principals of popular liberty and security, though it must be confessed this is more verbal than real. In the German-Italian war, Oldenburg sided with Prussia, and afterward joined the North German confederation. The duchy concluded, in 1866, a treaty with Prussia, by which the grand-duke renounced his claims to the Holstein succession, for the cession to him of a small portion of Holstein territory, and an indemnity of 1,000,000 thalers. Oldenburg is now included in the German empire.

OLDENBURG, capital of the grand-duchy of the same name, is pleasantly situated on the banks of the navigable river Hunte, 25 m. w.n.w. of Bremen. Pop. '80, 18,416. Oldenburg is the seat of the administrative departments, and the focus of the literary, scientific, and commercial activity of the duchy. It has a normal school, a military academy, a public library of 85,000 vols., a picture-gallery, museum, etc. The grand-ducal palace is worthy of note for its fine gardens, its valuable pictures, and other art collections, and its library. The principal church is St. Lambert's, containing the burying vaults of the reigning family. Oldenburg is the seat of an active river trade, and is noted for its excellent studs, and the great cattle and horse fairs which are annually held here in the months of June and August.

OLDENBURG, HOUSE OF, which lays just claim to being one of the oldest reigning families of Europe, has been rendered still more illustrious by various matrimonial alliances, which, in the course of ages, have successively been the means of creating new royal dynasties. Thus, for instance, in 1448, a scion of this house being elected king of Denmark, under the title of Christian I., became the progenitor of the Danish house of Oldenburg, the imperial house of Russia, the late royal family of Sweden, and the collateral and junior Danish lines of Augustenburg, Kiel, and Sonderburg-Glücksburg. Christian owed his election to the recommendation of his maternal uncle, duke Adolph of Schleswig, who, when the throne was offered to him on the sudden death of king Christopher, refused, on the ground of age, and proposed Christian of Oldenburg, who, as the direct descendant of Eric Glipping's daughter, princess Richissa, was allied to the old extinct house of Denmark. The death, in 1459, of Adolph, duke of Schleswig and count of Holstein, without male heirs, opened the question of succession to those states, which has since become one of such vexatious import. The ancient law of Denmark recognized hereditary fiefs only in exceptional cases; crowned fiefs being generally held for life or merely for a time *ad gratiam.* Such being the case, Schleswig might, on the death of Adolph, have been taken by the crown as a lapsed tenure; but Holstein, being held under the empire, would have been separated from it. Adolph and his subjects were alike anxious that Schleswig and Holstein should continue united; but although the Schleswig estates, at the wish of the duke Adolph, had recognized Christian as successor to the duchy before his accession to the throne of Denmark, the Holstein chambers were divided on the question of succession, the majority showing a preference for the claims of the counts of Schauenburg, who were descended from *male* agnates of the Holstein house. Christian in his eagerness to secure both states, was willing to sacrifice his rights in Schleswig to his schemes in regard to Holstein; and having bought over the Holstein nobles by bribes and fair promises, he was elected duke of Schleswig and count of Holstein at Ribe in 1460, where he signed a deed, alike derogatory to the interests and unworthy the dignity of his crown. In this compact, by which he bartered away the just prerogatives and independence of himself and his successors, for the sake of nominal present gain, he pledged his word for himself and his heirs, that the two provinces should always remain undivided, "*ewig bliben toosamende ungedeelt,*" and not be dismembered by division or heritage. This document, which remained for ages unknown or forgotten, was discovered by the historian Dahlmann amid the neglected papers of the Holstein state achives at Preetz, and proclaimed in 1848 by that ardent admirer of Germany as the unchangeable fundamental law of the Schleswig-Holstein provinces. The confusion, dissension, and ill-will to which this fatal deed has given rise, are the fruits which Christian's unscrupulous desire to secure power at any cost has produced for his descendants, whose complicated claims on the duchies, resulted, in 1864, in a war which cost Denmark a large portion of her territorial possession. From Christian I. descend two distinct banches of the Oldenburg line: 1. The royal dynasty, extinct in the male line in Frederick VII., late king of Denmark, and the collateral branches of Sonderburg-Augustenburg and Sonderburg-Glücksburg; 2. The ducal Holstein-Gottorp line, descended from duke Adolph, who died in 1586, and was the second son of king Frederick I. This prince had received, during his father's life-time, a portion of the Schleswig and Holstein lands, which he was permitted, on the accession of his elder brother, Chris-

tian III., to retain for himself and his heirs. This line became illustrious by the marriage of prince Karl Friedrich, the son of Hedwig-Sofia, eldest sister of Charles XII. of Sweden (a direct descendant of duke Adolph) with the grand-duchess Anna, daughter of Peter the great, and thus gave to Russia the dynasty which still occupies the imperial throne; while Adolph-Friedrich, a cousin prince Karl Friedrich, by his election to the throne of Sweden in 1751, added another crown to those already held by the house of Oldenburg. The conduct of his descendants rendered the new dignity short-lived, for with the abdication of Gustavus IV., in 1809, the Holstein-Gottorp dynasty became extinct in Sweden.

The complicated relations of the house of Oldenburg in regard to the Danish succession, after giving rise to much angry discussion among the princes interested in the question, and the Danish people themselves, led the great powers to enter into a treaty, known as the London treaty of 1852, for settling the question of succession, on the ground that the integrity of the Danish monarchy was intimately connected with the maintenance of the balance of power and the cause of peace in Europe. England, France, Austria, Prussia, Russia, Sweden, and Denmark, were parties to this treaty, in the first article of which it was provided, that on the extinction of the male line of the royal house, prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, and his male heirs, according to the order of primogeniture, should succeed to all the dominions, then united under the sway of the king of Denmark. The rights of succession, which rested with the Augustenburg family, were forfeited by a compact with the duke of Augustenburg, entered into for the surrender of his claims, in consideration of a sum of money paid to him by Denmark. The duke's morganatic marriage, and his subsequent rebellion, in 1848, against the Danish king, were the causes which led to the arrangement of this family compact on the existing terms. This treaty, known as the London protocol of May, 1852, was followed in October of the same year by the publication of a supplemtary clause, which stipulated, that on the extinction of the heirs-male of prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, the Holstein-Gottorp, or imperial Russian line should succeed to the Danish dominions. This article, even more than the original clauses of the treaty, met with the strongest opposition among the Danes, and after being twice rejected in the Landsthing, the London treaty was only ratified after a new election of members, and on the assurance of the king that in excluding all female cognate lines from the succession, there was no definite intention of advancing the claims of Russia. King Frederick's death, in 1863, brought on the crisis of the much-vexed question of the Danish succession; and although the London treaty was so far followed that prince Christian succeeded as king of Denmark, the evils that were anticipated from the measure were in 1864 made painfully manifest; for the duke of Augustenburg, notwithstanding the renunciation by his family of all claims to the succession, appealed to the federal diet for the recognition of his rights on Holstein; and the German powers, glad of a pretext to extend their influence beyond the Eider, occupied the Schleswig-Holstein (q.v.) territory, and suceeeded, by force of superior numbers, in advancing the boundary of Germany to the borders of Jutland. This led, however, to grave results affecting the whole of Europe. Prussia and Austria took possession of the conquests in their own names. The former power offered the latter pecuniary compensation for their assistance in the war, while indicating a determination to annex the duchies to its own dominions. Austria refused, and this led to the disastrous battle of Königgratz.

OLDHAM, a co. in n.w. Kentucky, bordering on Indiana, from which it is separated by the Ohio river, intersected by the Louisiana, Cincinnati and Lexington railroad; 200 sq.m.; pop. '80, 7,685—7,476 of American birth; 2,222 colored. The surface is hilly but fertile. Wheat, cotton, Indian corn, oats, and pork are the chief products. Limestone is found. Co. seat, La Grange.

OLDHAM, a parliamentary borough and flourishing manufacturing t. of England, in the co. of Lancashire, stands on the Medlock, 6 m. n.e. of Manchester. It owes its rapid increase in population and in wealth to the extensive coal-mines in the vicinity, and to its cotton manufactures, which have increased remarkably within late years. It is not only the great center of the hat-manufacture, but is also celebrated for its manufactures of fustians, velveteens, cords, cotton, woolen, and silk goods. Numerous silk-mills, brass and iron foundries, machine-shops, tanneries, rope-works, etc., are in operation. The parish church, the town-hall, the blue-coat, and the grammar-schools, are the chief edifices. Pop. in 1881 of municipal borough, 111,343; of parliamentary borough (which returns two members to parliament), 152,511.

OLDHAM, John; about 1590–1636; b. England; emigrated to Plymouth in 1623, and in association with Lyford endeavored to establish a separate worship on the Sabbath. He was also credited with the intention of changing the form of government at Plymouth. In 1633, he went from Dorchester to what is now Windsor, Conn., and his exploration resulted in the settlement of that town. He represented Watertown in the general court of 1634, and was killed in 1636 by Indians who came aboard his ship to trade. His murder brought on the Pequot war.

OLDHAM, John, 1653–83; b. England; educated at Oxford, where he won distinction by his proficiency in Latin and Greek, and by his English poetry. Want of means forced him to leave the university in 1674, and he soon secured employment as an usher at

the free school in Croydon Surrey. The first of his published poems was a Pindaric ode, on the death of his friend, Richard Morwent; it is rich in comparisons, and shows a tenderness in strong contrast with the fierce satire of his later works. He continued to cultivate poetry as a relief from the drudgery of "beating Greek and Latin for his life," as he describes it; and some of his MS. poems attracted the notice of the reigning London wits, sir Charles Sedley, the earl of Dorset, and the earl of Rochester, who paid him a visit at Croydon. By their influence he was made tutor to the sons of sir Edward Thurlow, with whom he lived till 1680. At this time he was engaged upon his *Satires upon the Jesuits*, which appeared in 1679, when the excitement in regard to the so-called "Popish plot" was at its height. They are full of bitterness and Protestant rancor, and gained for Oldham a high reputation. While tutor to the son of sir William Hicks, he became acquainted with Dr. Richard Lower, a famous London physician, and was induced to study medicine; but he abandoned it at the end of a year and, settling in London, devoted himself to literature. He was an intimate friend of Dryden and the other wits and satirists of the day. He refused the post of private chaplain to the earl of Kingston, who was his patron, and had proposed to have him enter holy orders. His last poem is called *A Sunday Thought in Sickness*, and is of a devotional character. His poems are forcible and vehement, but defective in versification. Oldham, in the opinion of Hallam, "ranks next to Dryden; he is spirited and pointed, but his versification is too negligent, and his subjects temporary."

OLDHA'MIA, a genus of fossil zoophytes, dedicated by Forbes to prof. Oldham, who was their discoverer. Only two species are known, but they are of peculiar interest, because, with their associated worm-tracts and burrows, they are the first distinct evidence of life on the globe. They exist as mere tracings on the surface of the laminæ of metamorphosed shales, all remains of the substance of the organism having entirely disappeared. The form of the hard polypidom is preserved, and shows a jointed main stem, giving off at each joint, in the one species, a circle of simple rays, and in the other a fan-shaped group. Forbes pointed out their affinities in some respects to the hydrozoa, and in others to the polyzoa. Kinahan, who described the genus at some length, considers them to have been hydrozoa allied to sertularia; while Huxley places them among the polyzoa.

OLD MAN OF THE MOUNTAIN. See ASSASSINS, *ante*.

OLDMIX'ON, JOHN, 1673–1742; b. England. He superintended and revised the first edition of bishop Kennett's collection of English historians. In 1708 he published *The British Empire in America*, 2 vols., later edition in 1741. In 1715–16 *Memoirs of North Britain* and *Memoirs of Ireland;* in 1727, *Clarendon and Whitlock Compared;* and in 1730, '35, '39, 3 vols., containing histories of the reigns of Henry VIII., Edward VI., Mary and Elizabeth, also of the Stuarts, William and Mary, Anne, and George I. In 1742 he published *Memoirs of the Press, Historical and Political, for Thirty Years.* He was a strong partisan, and was called a whig historian, defending whig principles even in his historical works. He was a severe and unscrupulous critic of Pope, Swift, Grey, and other celebrities of the time, in his contributions to the magazines, and his *Prose essay on Criticism*, which Pope notices in his *Dunciad.* As a reward for his services to the whig party, he was appointed collector of customs at the port of Bridgewater. He is said to have visited America.

OLD POINT COMFORT, a village and watering-place in Virginia, at the entrance of Hampton roads, and James river, 12 m. from Norfolk, and the site of fortress Monroe, the largest military work in the United States.

OLD RED SANDSTONE, the name given to a large series palæozoic rocks, of which red sandstones are the most conspicuous portions, but which contains also white, yellow, or green sandstones, as well as beds of clay and limestone. The group lies below the carboniferous strata, and was called "Old" to distinguish it from a newer series of similar beds which occur above the coal measures. The discovery that the highly fossiliferous calcareous rocks of Devonshire and the continent occupied the same geological horizon, showed that the name was very far from being descriptive of all the deposits of the period, and suggested to Murchison and Sedgewick the desirableness of giving them a new designation. They consequently proposed Devonian, which has been extensively adopted; but it is liable to the same objection as that urged against the name it was intended to supplant, inasmuch as it incorrectly limits geographically what the other limits lithologically. Many names used by geologists are similarly at fault; there is therefore no good reason why the old name should be given up, especially as it has been rendered classical by the labors and writings of Hugh Miller, the original monographer of these rocks.

The position of the old red sandstone series is easily determined, though the sequence of the various beds which form it is somewhat obscure. All the rocks are situated between the beds of the Silurian and carboniferous periods. In Wales, Scotland, and Ireland it has been observed that there is an old series of red sandstones which are more or less conformable with the underlying Silurians, and a newer series unconformable with the older strata, but conformable with the overlying carboniferous rocks. The great interval represented by this break has been believed to be that during which the calcareous

Devonian rocks were deposited. The recent researches, however, of Mr. Salter show that the one set of beds do not alternate with the other, but that they are really contemporaneous—the coarse shallow water deposits of conglomerate and sandstone having been formed on the shores of that sea in whose depths the deposits of thicker mass, finer grain, and lighter color, full of marine shells and corals, were at the same time being aggregated.

The strata of the period have been arranged in four groups. 1. Upper old red sandstone, including the Marwood and Petherwin groups. 2. Middle old red sandstone, including the Dartmouth and Plymouth groups. 3. Lower old red sandstone, including the North Foreland and Torbay groups. 4. Tilestones or Ledbury Shales.

1. The upper old red sandstones are conformable with the inferior strata of the coal measures, and differ so little petrologically, or even paleontologically from them, that they have been considered as the basement series of that period. They consist of yellowish and light-colored sandstones, which are at Dura Den, in Fifeshire, remarkably rich in some of their layers in the remains of Holoptychius, Pterichthys, Dendrodus, etc. In the south of Ireland, and at Dunse, similar beds contain a fresh-water shell very like the modern anodon, and fragments of a fern called *cyclopteris hibernicus*. Mr. Saltar has shown, from the intercalation of the marine beds with the red sandstone, and from the identity of the fossils, that the Devonian representatives of these beds are the Marwood and Potherwin groups. These consist of dark-colored calcareous and argillaceous beds, and gray and reddish sandstones. The fossils found in them are shells and land-plants, many of them belonging to the same genera, but different species to those which are found in the carboniferous system. The little crustacean Cypridina and Clymenia are so characteristic of this division, that in Germany the strata are known as the Cypridinien Schieffer and Clymenien Kalk.

2. The middle old red sandstone is represented in the north of Scotland by the Caithness flags, a series of dark-gray bituminous schists, slightly micaceous or calcareous, and remarkably tough and durable. Throughout their whole thickness they are charged with fossil fish and obscure vegetable remains. The characteristic fishes belong to the genera Coccosteus, Asterolepis, and Dipterus. The corresponding beds in Devonshire are the Dartmouth and Plymouth groups, which consist of extensive deposits of limestones and schists, all of them abounding in the remains of corals, trilobites, and shells. In the German equivalent, the Eifel limestone, but especially in the Russian, the characteristic invertebrate fossils of the Devonshire calcareous beds have been found associated with the remains of Coccosteus, showing beyond doubt the identity of these various beds. The Calceola Schieffer of German geologists belongs to the middle old red; it receives its name from the abundance in it of a singular brachiopod (*calceola sandalina*).

3. The lower old red sandstone consists of strata of red shale and sandstone, with beds of impure arenaceous limestone (cornstone), and frequently at the base great deposits of red conglomerate. The fossils peculiar to this division are the remarkable fish cephalaspis, and the huge crustacea of the genus Pterygotus, besides a few shells. To the south of the Grampians, the strata consists of a gray paving-stone and coarse roofing-slate. The Devonian representatives of this section are the sandstones and slates of the North Foreland, Linton, and Torbay, and the series of slaty beds and quartz ore sandstones developed on the banks of the Rhine near Coblentz. The Cephalaspis, so characteristic of the cornstones, has been found in the Rhenish beds.

4. The tilestones or Ledbury Shales consist of finely laminated reddish and green micaceous sandstones, which have been noticed underlying the old red only on its western borders in Herefordshire. The fossils of those beds show a Silurian fauna with a number of old red forms; the tilestones are consequently referred sometimes to the one period, and sometimes to the other.

The old red sandstone occupies a considerable portion of the surface of Great Britain. In the north, it forms the boundary lands of the Moray firth; beginning even as far north as the Shetlands and Orkneys, it covers the whole of Caithness, and in more or less broken tracts the east of Sutherland, Ross, and Cromarty, and the north of Inverness, Nairn, and Elgin. In the great central valley of Scotland it is the setting in which the coal measures are placed, stretching across the country on the one margin from Forfar to Dumbarton, and occurring on the other in separated tracts in Lanark and Berwick. In the southern division of the island it is limited to a large triangular district in the southwest. The apex of the triangle is at Wenlock, in Shropshire; a line thence to Start point, in Devon,, would limit it on the east, and a second to Milford haven would do so on the west. The Bristol channel bisects it. A depression in the Welsh portion is occupied with South Wales coal-field; and in a similar depression in Devon, the culm-beds are situated. In Ireland, strata of this age are found in the counties of Kilkenny, Waterford, Cork, and Kerry. The Devonian rocks have been carefully studied in Belgium and the Rhine district, and also in Russia, where they cover a larger district in the north of the empire. The American representatives of this period are extensively developed in New York, Pennsylvania, and Canada. The invertebrate animals found in the old red do not differ much from those of the Upper Silurian. Corals are remarkably abundant and beautiful in the Devonian limestones. Goniatites and Clymenia make their first appearance in this period, with several forms of lower mollusca. Trilobites are still

numerous. But the most striking feature in the period is the abundance of fish of curious forms, strongly protected outside by hard bony cases, or by a dense armor of ganoid scales.

OLD SOUTH CHURCH, Boston. See page 895.

OLDTOWN, a t. in Penobscot co., Me., on the w. bank of Penobscot river, and the European and North American, and the Bangor and Piscatiquis railroads, 12 m. n. of Bangor; pop. '80, 3,395. It was set off from Orono in 1840, and consists of the four villages, Oldtown, Pushaw, Great Works, and Upper Stillwater. It has a heavy water power, and many saw and lumber mills, one of which is said to be the largest in the world. A boom built across the Penobscot at a cost of $100,000 keeps lumber from drifting out to sea. The lumber trade is the chief business; furniture, carriages, barrels, and shingles are also made. There are a number of churches and a bank. A railroad bridge spans the Penobscot at this point.

OLDYS, WILLIAM, a most erudite and industrious bibliographer, was a natural son of Dr. William Oldys, chancellor of Lincoln, and advocate of the admiralty court, and was born in 1687. Regarding his early life little is known. His father dying in 1708 left him a small property, which Oldys squandered as soon as he got it into his own hands. The most of his life was spent as a bookseller's hack. He drank hard, and was so scandalously fond of low company that he preferred to live within the "rules" of the Fleet prison to any more respectable place. As may easily be supposed from his habits, the dissolute old bookworm was often in extremely necessitous circumstances, and when he died (April 15, 1761) he left hardly enough to decently bury him. It is but fair to add that Oldys had some sterling merits. Capt. Grose, who knew him, praises his good-nature, honor, and integrity as a historian, and says that "nothing would ever have biased him to insert any fact in his writings which he did not believe, or to suppress any he did." For about ten years Oldys acted as librarian to the earl of Oxford, whose valuable collection of books and MSS. he arranged and catalogued. His chief works are: *The British Librarian, Exhibiting a Compendious Review of all Unpublished and Valuable Books in all Sciences* (London, 1737, anonymously); a *Life of Sir Walter Raleigh*, prefixed to Raleigh's *History of the World* (1738); a translation of Camden's *Britannia* (2 vols.); *The Harleian Miscellany, or a Collection of Scarce, Curious, and Entertaining Tracts* (8 vols. Lond. 1753). Besides these, Oldys wrote a great variety of miscellaneous literary and bibliographical "articles" for his friends the booksellers, which it would be tedious to mention.

OLEA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves and flowers in racemes or panicles. The calyx is in one piece, divided, persistent; the corolla is hypogynous, generally 4-cleft, sometimes of four petals, sometimes wanting; there are generally two, rarely four stamens; the ovary is free, 2-celled, the cells 2-seeded; the fruit is a drupe, a capsule, or a samara (see these heads); the cotyledons are foliaceous. Nearly 150 species are known, mostly natives of temperate countries. Among them are the olive, ash, lilac, privet, phillyrea, fringe tree, etc. Between some of these there is a great dissimilarity, so that this order is apt to be regarded as a very heterogeneous group; but the real affinity of the species composing it is manifested by the fact that even those which seem most unlike can be grafted one upon another, as the lilac or the olive on the ash. Bitter, astringent, and tonic properties are prevalent in this order.

OLEAN'DER, *Nerium*, a genus of plants of the natural order *apocynaceæ*, having a 5-parted calyx, set round on the inside at the base with many tooth-like points or glands, a salver-shaped 5-cleft corolla, in the throat of which is a 5-parted and toothed or lacerated corona, five stamens, the anthers adhering to the stigma, the fruit composed of two follicles. The species are evergreen shrubs with leathery leaves, which are opposite or in threes; the flowers in false umbels, terminal or axillary. The COMMON OLEANDER (*N. oleander*), a native of the south of Europe, the north of Africa, and many of the warmer temperate parts of Asia, is frequently planted in many countries as an ornamental shrub, and is not uncommon in Britain as a window-plant. It has beautiful red or sometimes white flowers. The English call it ROSE BAY, and the French ROSE LAUREL (*laurier rose*). It attains a height of 8 or 10 feet. Its flowers give a splendid appearance to many ruins in the south of Italy. It delights in moist situations, and is often found near streams. All parts of it contain a bitter and narcotic-acrid juice, poisonous to men and cattle, which flows out as a white milk when young twigs are broken off. Cases of poisoning have occurred by children eating its flowers, and even by the use of the wood for spits or skewers in roasting meat. Its exhalations are injurious to those who remain long under their influence, particularly to those who sleep under it. A decoction of the leaves or bark is much used in the south of France as a wash to cure cutaneous maladies.—*N. odoratum*, an Indian species, has larger flowers, which are very fragrant.—*N. piscidium* (or *Eschaltum piscidium*), a perennial climber, a native of the Kasya hills, has a very fibrous bark, the fiber of which is used in India as hemp. The steeping of the stems in ponds kills fish.

OLEAS'TER. See ELÆAGNUS.

OLE BULL. See BULL, OLE BORNEMANN, *ante*.

O'LEFIANT GAS (C_4H_4) is transparent and colorless, possesses a disagreeable alliaceous odor, and acts as a poison when breathed. Its specific gravity is 0.981. It takes fire when brought in contact with a flame, and burns with a bright clear light. When this gas is mixed with oxygen or atmospheric air in the proportion of 1 volume with 3 volumes of oxygen, or with 15 volumes of atmospheric air, it forms a powerfully explosive mixture. It is more soluble in cold than in hot water—100 volumes of water at 32° absorbing 26.5 volumes of the gas, while at 68° they only absorb 14 volumes. It was liquefied by Faraday under great pressure, but remained unfrozen at 166°. If it be conducted through strongly-heated tubes, or if a continuous series of electric sparks be passed through it, it is decomposed into a very dense black carbon, and double its own volume of hydrogen; and if it is subjected to a less intense heat, the products of decomposition are carbon and light carbureted hydrogen or marsh gas (C_2H_4). Chlorine acts upon this gas in a very remarkable manner. When the two gases are mixed in equal volumes, they combine to form a heavy oily liquid, to which the term chloride of olefiant gas, or Dutch liquid (q.v.), is given. It is from this reaction that the term *olefiant* was originally applied to this gas.

Olefiant gas is a constituent of the gaseous explosive admixtures that accumulate in coal-pits, and of the gaseous products yielded by the distillation of wood, resinous matters, and coal; and the brightness of the flame of ordinary gas is in a great measure dependent upon the quantity of olefiant gas that is present.

This gas is most readily obtained by the action of oil of vitriol on alcohol; the reactions that ensue are too complicated to be described in these pages.

O'LEIC ACID ($C_{36}H_{33}O_3,HO$), at temperatures above 57°, exists as a colorless limpid fluid, of an oily consistence, devoid of smell and taste, and (if it has not been exposed to air) exerting no action on vegetable colors. At 40° it solidifies into a firm, white, crystalline mass, and in this state it undergoes no change in the air; but when fluid it readily absorbs oxygen, becomes yellow and rancid, and exhibits a strong acid reaction with litmus paper. It is not a volatile acid, and on the application of a strong heat it breaks up into several substances, such as caproic, caprylic, and sebacic acids—the last named being the most characersitic product of the distillation. If oleic acid be exposed to the action of hyponitric acid (NO_4), it is converted into an isomeric, solid, fatty acid, termed *elaidic acid*. A very small quantity of hyponitric acid (1 part to 200 of oleic acid) is sufficient to effect this remarkable change, the nature of which is unknown. When distilled with moderately strong nitric acid, it is oxidized into a large number of products, including all the volatile fatty acids represented by the formula $C_{2n}H_{2n}O_4$, from formic acid ($C_2H_2O_4$) to capric acid ($C_{20}H_{20}O_4$), with six fixed dibasic acids of the formula $C_{2n}H_{2n-2}O_8$, viz., succinic acid, lipic acid, adipic acid, pimelic acid, suberic acid, and anchoic (or lepargylic) acid. When heated with hydrated potash it breaks up into palmitic and acetic acids, as shown in the equation:

$$\overbrace{C_{36}H_{34}O_4}^{\text{Oleic Acid.}} + \overbrace{2(KO,HO)}^{\text{Hydrated Potash.}} = \overbrace{C_{32}H_{31}O_3,KO}^{\text{Palmitate of Potash.}} + \overbrace{C_4H_3O_3,KO}^{\text{Acetate of Potash.}} + 2H$$

These decompositions and disintegrations seem to illustrate the facility with which, by the mere process of oxidation, which is perpetually at work in living structures, one organic acid can be converted into others.

Oleic acid is a constituent of *oleine* (q.v.), which exists in most of the fats and fatty oils of the animal and vegetable kingdoms, and most abundantly in the liquid fats or oils, and hence its name is derived. It is very difficult to obtain the acid in a state of purity, in consequence of the readiness with which it oxidizes; and we shall not enter into details regarding the method of its preparation. It is obtained in a crude form, as a secondary product, in the manufacture of stearine candles, but almond oil is generally employed when the pure acid is required.

Oleic acid forms normal (or neutral) and acid salts; but the only compounds of this class that require notice are the normal salts of the alkalies. These are all soluble, and by the evaporation of their aqueous solution form *soaps*. Oleate of potash forms a soft soap, which is the chief ingredient in Naples soap; while oleate of soda is a hard soap, which enters largely into the composition of Marseilles soap.

The oleates of the alkalies occur in the animal body, in the blood, chyle, lymph, and bile; they have also been found in pus, in pulmonary tubercles, and in the excrements, after the administration of purgatives.

O'LEINE ($C_{114}H_{104}O_{12}$) is proved, by the researches of Berthelot, to be a triglyceride of oleic acid. See GLYCERINE. Pure oleine is a colorless and inodorous oil, which solidifies into acicular crystals at about 23°, is insoluble in water, and only slightly soluble in cold alcohol, but dissolves in ether in all proportions. By exposure to the air it darkens in color, becomes acid and rancid (from the gradual decomposition of the oleic acid), and finally assumes a resinoid appearance. Hyponitric acid converts it into an isomeric, white, solid fat, named *elaidine*—the glyceride of the elaidic acid described in the preceding article.

Pure oleine is obtained by cooling olive oil to 32°, which occasions the separation of the stearine and palmitine in a solid form. The fluid portion is then dissolved in alcohol, which on being cooled to 32° deposits in a solid form everything but oleine,

which is obtained in a pure state by driving off by heat the alcohol from the decanted or filtered solution.

The drying oils, such as those of linseed, hemp, walnut, poppy, etc., contain a variety of oleine, which is not converted into elaidine by the action of hyponitric acid, or of subnitrate of mercury, which, when prepared without the aid of heat, contains enough of the acid to produce a similar effect. Hence these substances may be used to detect fraudulent adulterations of olive or almond oil with poppy and other cheap drying oils.

OLEOGRAPH. See page 896.

*OLEOMARGARINE, from the Latin *oleum*, oil, and *marga* (the latter from the Greek *margarete*) a pearl; margarine being the solid derived from olive and other oils under pressure, and so-called from its pearl-like appearance. The name is applied to a product of beef fat, and was given to it by act of the legislature of New York, with a view to prevent the sale of the article as dairy butter, by having it stamped or branded legibly with this name under penalty duly applied for neglect thereof. The material of which the article is manufactured is beef fat, excepting the suet and the fat of the kidneys, which parts are left in the carcass for the butcher. The caul and the enveloping fat of the intestines only are employed—except in cases of adulteration. The process of manufacture is as follows: the beef carcass having been permitted to hang until the animal heat has entirely left it, the fat is placed in tanks of cold water and thoroughly cleansed from all impurities, this process being three times repeated. It is next conveyed to the cutting-machine, an instrument supplied with revolving knives, which cut it into small bits, when it is forced as a pulp through a screen or colander. This pulp is now placed in the melting-kettle, in which it is subjected to a heat of 112° to 118° F., being at the same time vigorously stirred by an *agitator*, or paddler, worked by machinery. From the melting-kettle the melted fat is run into a series of vats, the refuse or residuum passing through a valve in the bottom of the kettle, and into receptacles for tallow. From the vats the oil is transported in metal-lined coolers (wagons drawn by hand) to a room which is kept at a temperature of 85° to 87°, where it becomes a granulated mass. In this form it is served to the hydraulic presses by the following method: an upright shaft, having a revolving horizontal wheel at the top, stands at a convenient height from the ground for service. On the outer extremity of the spokes of this wheel are arranged boxes in which the material is placed, being first packed in cloths; it thus takes form, like that of a square loaf of bread, being then transferred to metal plates in the press, plate after plate being covered in layers until the press is full. The power is then applied, when the pure oil runs off into a reservoir, and the residue (stearine) is left in thin white sheets resembling paraffine. These are afterwards collected and packed in hogsheads, for disposal to those who make use of the article. The solid elements of the fat have now been entirely eliminated in the stearine, the tallow, and the refuse—the latter being the wash of the coolers, which is obtained by thoroughly scalding the latter. This is afterwards run through gutters into the tallow-room. Here it passes into a large tank, from which it is removed in barrels to an iron vat resembling a vertical boiler, where it is put under steam-pressure and the tallow obtained; the whole of which goes to the soap manufacturers and tallow-chandlers, the final refuse in the iron vat being expelled through a manhole, packed in casks, and disposed of for fertilizing purposes. From the press-room reservoir, the oil is pumped to the butter-room, where it is received in large churns worked by steam-power. In these, after being combined with a proportion of one-fifth milk, it goes through a churning process which occupies about forty minutes. From the churns the product is run into coolers containing broken ice, with which it is thoroughly mixed to solidify it, being afterwards separated from the ice on tables. The butter, being of unequal consistency and temperature, is next passed through a machine called a crusher, out of which it comes a perfectly homogeneous mass. It now goes to the salting-table, where it is salted and worked, after which it is packed in boxes, firkins, and barrels, every package being branded "oleomargarine" according to law. This manufacture in New York amounts to about 350,000 lbs. per week; there are manufactories in other cities as to which no statistics are available. In 1880 the article interfered so greatly with the sale of dairy butter, particularly in competition with the export trade in the latter, through false representation, as to arouse a powerful opposition to its manufacture and sale, both on the part of dairymen, and that of the New York produce exchange. See *Supp.*, page 896.

OLEOM'ETER, or ELAÏOMETER, an instrument for ascertaining the densities of fixed oils. It consists of a very delicate thermometer-tube, the bulb being large in proportion to the stem. It is divided into fifty degrees, and floats at zero in pure oil of poppy-seed, at 38° to 38½° in pure oil of almonds, and at 50° in pure olive oil.

O'LEOPHOSPHO'RIC ACID is a yellow viscid substance, which is insoluble in water and cold alcohol, but dissolves readily in boiling alcohol and in ether. When boiled for a long time with water or with alcohol, or when treated with an acid, it resolves itself into oleine and phosphoric acid; while alkalies decompose it into phosphoric acid, oleates, and glycerine. It exists, according to Frémy and other chemists, in the brain, spinal cord, kidneys, and liver.

OLERON, ISLE OF (anc. *Uliarus*), an island of France, forming a portion of the department of Charente-Inférieure, lies off the w. coast of France, opposite the mouth of the river Charente. It is 19 m. long, and about 5 m. broad, and is unusally fertile, pro-

ducing abundantly all the crops grown in the department to which it belongs. See CHARENTE-INFÉRIEURE. At its northern extremity, is the light-house of Chassiron. In the sea-port of Oléron, distilleries, rope-walks, and ship-building yards are in operation. The town of Sainte-Pierre-d'Oléron (pop. 1,575) stands near the center of the island. The pop. of the island is given at 10,000.

OLERON, LAWS OF, or JUDGMENTS D'OLÉRON, a celebrated code of maritime law compiled in France in the reign of St. Louis, and so named from a groundless story, that it was enacted by Richard I. of England during the time that his expedition to Palestine lay at anchor at that island. The real origin of these laws was a written code, called *Il Consolato del Mare,* of about the middle of the 13th c., compiled either at Barcelona or at Pisa, forming the established usages of Venice and the other Mediterranean states, and acceded to by the kings of France and counts of Provence. Besides containing regulations simply mercantile, this system defined the mutual rights of belligerent and neutral vessels, as they have been since understood in modern international law. The so-called laws of Oléron were a code of regulations borrowed from the *Consolato,* which for several centuries were adopted as the basis of their maritime law by all the nations of Europe. Copies of the *Jugements d'Oléron* are appended to some ancient editions of the *Coutumier de Normandie.* See NORMANDY, CUSTOMARY LAW OF.

OLGA, SAINT, a saint of the Russian church, wife of the duke Igor of Kiev, who, having undertaken an expedition against Constantinople, which proved unsuccessful, was slain on his return to his own dominions. His widow Olga avenged his death, assumed the government in his stead, and for many years governed with much prudence and success. Having resigned the government to her son Vratislaf about the year 952, she repaired to Constantinople, where she was baptized, by the patriarch Theophilaktes, and received into the church, assuming at baptism the name of Helena, in honor of St. Helena, mother of Constantine. She returned to Russia, and labored with much zeal for the propagation of her new creed; but she failed in her attempt to induce her son, Swäntoslav, to embrace Christianity. Her grandson, Vladimir, having married Chrysoberga, the sister of the emperors of Constantinople, Basil and Constantine, was baptized in the year 988; but his grandmother did not live to enjoy this gratification, having died in 978, or, according to other authorities, as early as 970. She is held in high veneration in the Russian church. Her festival is held on July 21, and the practice of venerating her appears to date from the early period of the Russian church, before the schism between the Eastern and Western churches.

OLHAO', a t. of Portugal, on the sea-coast, near Cape de St. Maria, and 5 m. e. from Faro. Pop. 7,025.

OLIB'ANUM, a gum-resin, which flows from incisions made in *boswellia serrata,* a tree found in some parts of the east. See BOSWELLIA. It is the *lebonah* of the Hebrews, *libanos* or *libanotos* of the Greeks, *thus* of the Romans, of all which terms the ordinary English translation is *frankincense* (q.v.). It occurs in commerce in semi-transparent yellowish tears and masses; has a bitter nauseous taste; is hard, brittle, and capable of being pulverized; and diffuses a strong aromatic odor when burned. It was formerly used in medicine, chiefly to restrain excessive mucous discharges; but its use for such purposes is now rare. It sometimes enters as an ingredient into stimulating plasters. It is chiefly employed for fumigation, and is used as incense in Roman Catholic churches. It is sometimes distinctively called *Indian olibanum;* a similar substance, in smaller tears, called *African olibanum,* being produced by *boswellia papyrifera,* a tree found growing on bare limestone rocks in the e. of Abyssinia, and sending its roots to a great depth into the crevices of the rock. The middle layers of the bark are of fine texture, and are used instead of paper for writing.

O'LIFANT'S RIVER. Two considerable streams of this name are found in the cape Colony. The Olifant's river west rises in the Winterhoek mountains, and enters the Atlantic in lat. 31° 40', after a course of 150 m,, and a basin of drainage of 25,000 sq.m.—The Olifant's river east drains a great part of the district of George, and joins the Gauritz river 60 m. above the entrance of that river into the sea. Its course is upwards of 150 m. in length, and it is more available for irrigation than almost any other cape river.

O'LIGARCHY (*oligos,* few, and *archo,* to govern), a term applied by Greek political writers to that perversion of an aristocray in which the rule of the dominant part of the community ceases to be the exponent of the general interests of the state, owing to the cessation of those substantial grounds of pre-eminence in which an aristocracy originated. The governing power in these circumstances becomes a faction, whose efforts are chiefly devoted to their own aggrandizement and the extension of their power and privileges.

OLIGOCHÆTA, an order of annelids, of which the common earth-worm is a good example. Their locomotive appendages are in the form of bristles attached in rows to the sides and ventral surface of the body; no branchiæ; all hermaphrodite; young pass through no metamorphosis. The order is divided into two families, *terricolæ* or earth-worms, and *limicolæ* or mud-worms and water-worms. These families have also been named, respectively, *lumbricidæ* and *naidæ.* In the *lumbricus* or common earth-worm (q.v.), the edentulous mouth opens by a muscular pharynx and short œsophagus to a muscular crop or *pro-ventriculus,* succeeded by a second muscular stomach or gizzard. Salivary

glands open into the pharynx, and other digestive glands open into the gullet. The perivisceral cavity is lined by a cellular membrane, which is continuous with a yellow cellular layer covering the intestine and large vessels, and which casts off its cells into the perivisceral fluid. The blood circulating in the pseudo-hemal system is non-corpusculated, although red, while that contained in the body cavity is colorless, but contains corpuscles. In all the oligochæta the segmental organs communicate with the perivisceral cavity, and also externally with the outer medium. The most common example of the naidæ is the *tubifex rivulorum*, found in the mud of ponds and streams. It is 1 or 1½ in. long and of a bright red color. The pseudo-hemal system is provided with two contractile cavities or hearts, and a system of tubes similar to that in the earth-worm, and also a system of lateral tubes opening externally. The reproduction is both non-sexual and sexual. Before maturity the young naïs throws out a bud between two rings, at a point generally near the middle of the body, and the strange phenomenon of this bud developing into a new individual, as well as each of the two parts of the parent on either side of this point, takes place. That portion of the parent in front of the bud develops a tail, whilst the portion behind the bud develops a head. Besides their non-sexual reproduction the naidæ after going through a metamorphosis attain sexual reproduction.

OLIN, Henry, 1757–1837; b. Vermont, and spent his earlier years in Addison county. He was a member of the general assembly consecutively from 1799 till 1825, excepting four years; also a member of three constitutional conventions. He was associate judge in 1801, chief judge in 1807, member of congress in 1824, and lieut.-gov. in 1827. Stephen Olin, the Methodist minister and educator, was his son.

OLIN, Stephen, d.d., ll.d.; 1797–1851; b. Vt.; oldest son of Henry, who was judge of the supreme court of Vermont, member of congress, and lieut.-gov. The son graduated at Middlebury college in 1820, with the highest honors of his class. His health being impaired by intense study, he went to South Carolina, and became the principal of Abbeville academy. While there, he abandoned the study of law which he had commenced, and entered the ministry of the Methodist Episcopal church, and in 1824 was admitted to the South Carolina conference. He was stationed in Charleston for two years, where, associated with another, he preached to four congregations, in which were 3,000 slaves. Of these he received 200 into the church. In July, 1826, he was elected professor of English literature in the university of Georgia, where he remained seven years. In 1834 he was inaugurated president of Randolph Macon college, Va., which under his administration had great prosperity. In 1837–41 he made an extended tour in Europe and the east, and in 1843 published in 2 vols. *Travels in Egypt, Petra, and the Holy Land*. His account of Egypt was pronounced "the best, on the whole, in the language." In his *Travels* he spoke of "a broken arch supposed to be the remains of an ancient bridge connecting the Temple with Mount Zion, as having been known to Mr. Catherwood, and other travelers and residents," for which he was accused in the *North American Review* of plagiarism, Dr. Robinson in his *Biblical Researches* and in the *Bibliotheca Sacra*, having claimed to be the discoverer of this monument, and especially to have been the first to recognize in this fragment of an arch the remnant of the bridge spoken of by Josephus. A controversy ensued, in which Dr. Olin positively denied the charge of plagiarism, supporting his denial by the testimony of two missionaries, the rev. Dr. Hamlin and the rev. Mr. Homes, the latter declaring that he himself informed Dr. Robinson of the existence of the arch as a remnant of the bridge mentioned by Josephus. In 1842 Dr. Olin was elected president of the Wesleyan university in Middletown, Conn., where he remained till his death. During his administration the college prospered greatly, and attained a high rank. He excelled as an educator. He contributed to the *Wesleyan Journal*, *The Christian Advocate and Journal*, and the *Methodist Quarterly Review;* two volumes of *Sermons, Lectures, and Addresses*, also a work entitled *Greece and the Golden Horn* appeared after his death. In 1853 were published his *Life and Letters*, edited by Mrs. Olin, assisted by Dr. McClintock, Dr. Holdich, and other friends. The *New Englander* says of him: "He had the real celestial fire of sacred oratory. He had great power of insight and logic; but his chief strength lay in the enkindling and electric energy of his sympathetic and emotional nature."

OLINDA, a suburb of Pernambuco (q.v.).

OLIN'DA, a city of Brazil, in the province of Pernambuco, and 4 m. n.e. from Pernambuco. It was formerly the capital of the province, and there were bloody contests between Spain and Holland for the possession of it. It is still a bishop's seat, Pernambuco being included in the diocese. The whole aspect of the town is that of a place half deserted. Pop. 8,000.

OLINDA, Pedro de Araujo Lima, Marquis of, 1790–1870; b. in Pernambuco, Brazil; educated there and studied law at the university of Coimbra, Portugal. In 1820 he became a member of the Portuguese assembly, and on his return to Brazil was elected to that of Brazil, and was a member until his death. He was three times president of the chamber of deputies, four times minister of state, and twice regent in the minority of Pedro II. He was made viscount in 1841, and marquis in 1854. In politics he was liberal but not a radical.

OLIPHANT, Laurence, b. England, 1829; son of sir Anthony, chief justice of Ceylon. He went to India when quite young, and visited the Nepaulese court. He published in 1852 a description of this visit, under the title of *A Journey to Katmandhu, or the Nepaulese Ambassador at Home.* He read law at the university of Edinburgh, and was admitted to the Scotch, and afterwards to the English bar. In 1852 he traveled through Russia and the Crimea, an account of which tour appeared in 1853 as *The Russian Shores of the Black Sea.* He was appointed private secretary to the earl of Elgin, gov.gen. of Canada, and was for a time superintendent of Indian affairs in Canada. In 1855 he he published an account of his travels in the United States and Canada, called *Minnesota and the Far West;* and soon afterwards a pamphlet on the Crimean war, called *The Coming Campaign.* In 1856 appeared his *Transcaucasian Campaign under Omer Pasha.* He went to China in 1857, as private secretary and historiographer to lord Elgin. In 1860 he published *A Narrative of the Earl of Elgin's Mission to China and Japan;* and *Patriots and Filbusters; Incidents of Travel.* In 1861 he was *chargé d'affaires* in Japan, where he was dangerously wounded by assassins. He was returned to parliament in 1865, but resigned in 1868, when, with his mother, lady Oliphant, he joined the community of the "brotherhood of the new life" at Portland, Chautauqua co., N. Y., where he remained for about two years. In 1870 he was at Paris, a correspondent of the London *Times*, and he was the American Manager of the direct cable company, 1873–75. He published *Piccadilly; a Fragment of Contemporaneous Biography* (1870); *The Land of Gilead* (1881); *Traits and Travesties*, including the well-known *Tender Recollections of Irene McGillicuddy* (1882), and *Albiova Peto* (1883).

OLIPHANT, Mrs. Margaret (*née* Wilson), one of the most distinguished of our living female novelists, was born about the year 1820. The prevalent impression that she is a Scotchwoman, naturally enough derived from the obvious fondness with which in her earlier works she has treated Scottish character and incident, is not strictly correct, She is a native of Liverpool; her mother was, however, a Scotchwoman of a somewhat remarkable type, strongly attached to old traditions. In 1849 Mrs. Oliphant published her first work, *Passages in the Life of Mrs. Margaret Maitland of Sunnyside*, which instantly won attention and approval. Its most distinctive charm is the tender humor and insight which regulate its exquisite delineation of Scottish life and character at once in their higher and lower levels. This work was followed by *Merkland* (1851); *Adam Graeme of Mossgray* (1852); *Harry Muir* (1853); *Magdalen Hepburn* (1854); *Lilliesleaf* (1855); and subsequently by *Zaidee*, *Katie Stewart*, and *The Quiet Heart*, which originally appeared in succession in *Blackwood's Magazine.* Though these are of somewhat various merit, in all of them the peculiar talent of the writer is marked. They are rich in the minute detail which is dear to the womanly mind; have nice and subtle insights into character, a flavor of quiet humor and frequent traits of delicacy and pathos in the treatment of the gentler emotions. It is, however, on the *Chronicles of Carlingford* that her reputation as a novelist was first secured. In the first of the two sections separately published, apart from its other merits, which are great, the character of little Netty, the heroine, vivifies the whole work, and may rank as an original creation. The other, *Salem Chapel*, perhaps indicates a wider and more vigorous grasp than is to be found in any other work of the authoress. Certain of the unlovelier features of English dissent, as exhibited in a small provincial community, are here graphically sketched, and adapted with admirable skill to the purposes of fiction. More recent novels are *Three Brothers* (1870), *Squire Arden* (1871), *Ombra* (1872), *A Rose in June* (1874), *Phœbe Junior* (1876), *The Primrose Path* (1878), *Within the Precincts* (1879), *A Little Pilgrim* (1882), *The Ladies' Lindores* (1883), *etc.* Other works are *Life of Edward Irving*; *St. Francis of Assisi; Memoir of the Comte de Montalembert; The Makers of Florence; The Literary History of England* from 1790 to 1825 (1882), and *Danté* and *Cervantes* in the *Foreign Classics for English Readers*, of which Mrs. O. is editor.

OLIVA, a genus of gasteropod mollusks of the family *buccinidæ*, order Prosobranchiata. See Invertebrate Animals, sub-kingdom mollusca, division B, mollusca proper, class II., Gasteropoda, section A, order I., family 3. They are sometimes classed with the *volutidæ*, see as above, family 5. The genus has the following characters: animal involved, compressed, with a small head terminated by a proboscis; tentacles approximated, enlarged at their base, and subulate at their extremities, carrying the eyes on small convexities about their middle part externally; foot very large, oblong, and slit transverse anteriorly; mantle with a single lateral lobe covering the shell in great part, with two tongue-like processes at the side of the branchial opening, and forming in front a very elongated siphon; a single branchial pectination. Oliva is one of the richest in color of shell and in variety of species, which form considerable sections in the cabinets of many collectors. *O. textilina*, the "astrolabe," has a cinereous white shell, subreticulated with flexuous dotted lines, with two brown bands, covered with characters, as though hieroglyphic. This beautiful shell with its animal is found in the Antilles and New Guinea. *O. maura* has a cylindrical shell, with the apex rounded and a slight depression (retuse); aperture white, East Indian ocean and Australia. *O. sanguinolenta* has a cylindrical shell, very beautifully and delicately reticulated, with reddish-brown small lines, girt with two brown zones; the pillar orange-red. It is found in the East Indian ocean and on the coast of Timor. These species have been found at various depths, from

the surface to 12 fathoms, on mud, sandy mud, coarse sand, etc. They are very carniverous, but live only upon the juices of other animals. They are taken at the Mauritius in the following manner: a line is secured in position near the bottom of the sea, to which short lines with nooses containing pieces of the arms of cuttle fish are attached, so that they touch the bottom. After the apparatus has remained for a time in position one end is raised from a boat, and examined along its course, and the animals which adhere to the cuttle fish removed.

OLIVAREZ, Don Gasparo de Guzman, Count of, duke of San Lucar, and prime-minister of Philip IV. of Spain, was b. Jan. 6, 1587, at Rome, where his father was ambassador. He belonged to a distinguished but impoverished family, received a learned education, became the friend of Philip IV., his confidant in his amours, and afterwards his prime-minister, in which capacity he exercised almost unlimited power for 22 years. Olivarez showed ability for government, but his constant endeavor was to wring money from the country that he might carry on wars. His oppressive measures caused insurrections in Catalonia and Andalusia, and roused the Portuguese to shake off the Spanish yoke in 1640, and make the duke of Braganza their king, an event which Olivarez reported to Philip with satisfaction, as it enabled him to confiscate the duke's great estates in Spain. But the arms of Spain being unsuccessful, the king was obliged to dismiss the minister in 1643. He would probably have been recalled to the head of affairs, but for a publication in which he gave offense to many persons of influence. He was ordered to retire to Toro, and confine himself to that place, where he died, July 12, 1645. (Cespedes, *Hist. De Felipe IV.*)

OLIVE, *Olea*, a genus of trees and shrubs of the natural order *oleaceæ;* having opposite, evergreen, leathery leaves, which are generally entire, smooth, and minutely scaly; small flowers in compound axillary racemes, or in thyrsi at the end of the twigs; a small 4-toothed calyx, a 4-cleft corolla, 2 stamens, a 2-cleft stigma; the fruit a drupe. The species are widely distributed in the warmer temperate parts of the globe. The Common Olive (*O.Europæa*), a native of Syria and other Asiatic countries, and perhaps also of the s. of Europe, although probably it is there rather naturalized than indigenous, is in its wild state a thorny shrub or small tree, but through cultivation becomes a tree of 20–40 ft. high, destitute of spines. It attains a prodigious age. The cultivated varieties are very numerous, differing in the breadth of the leaves, and in other characters. The leaves resemble those of a willow, are lanceolate, entire, of a dull dark-green color above, scaly and whitish-gray beneath; the flowers small and white, in short dense racemes; the fruit greenish, whitish, violet, or even black, never larger than a pigeon's egg, generally oval, sometimes globular, or obovate, or acuminate. The fruit is produced in vast profusion, so that an old olive-tree becomes very valuable to its owner. It is chiefly from the pericarp that olive oil is obtained, not from the seed, contrary to the general rule of the vegetable kingdom. Olive oil is much used as an article of food in the countries in which it is produced, and to a smaller extent in other countries, to which it is exported also for medicinal and other uses (see Oils). Olives, gathered before they are quite ripe, are pickled in various ways, being usually first steeped in lime-water, by which they are rendered softer and milder in taste. They are well known as a restorative of the palate, and are also said to promote digestion. Disagreeable as they generally are at first, they are soon greatly relished, and in the s. of Europe are even a considerable article of food. Dried olives are there also used, as well as pickled olives.—The wood of the olive-tree takes a beautiful polish, and has black cloudy spots and veins on a greenish-yellow ground; it is principally used for the finest purposes by cabinet-makers and turners. The wood of the root is marked in a peculiarly beautiful manner, and is used for making snuff-boxes and small ornamental articles. The bark of the tree is bitter and astringent; and both it and the leaves have febrifuge properties. A gum resin exudes from old stems, which much resembles storax, has an odor like vanilla, and is used in all parts of Italy for perfumery.—Among the Greeks the olive was sacred to Pallas Athene (Minerva), who was honored as the bestower of it; it was also the emblem of chastity. A crown of olive-twigs was the highest distinction of a citizen who had merited well of his country, and the highest prize of the victor in the Olympic games. An olive branch was also the symbol of peace (compare Gen. viii. 11); and the vanquished, who came to supplicate for peace, bore olive branches in their hands.—The olive has been cultivated in Syria, Palestine, and other parts of the east, from the earliest times. Its cultivation extends southwards as far as Cairo, and northwards to the middle of France. It is very generally propagated by suckers, but where great care is bestowed on it, inarching is practiced. It grows from cuttings. The climate of England is too cold for the olive, yet in Devonshire it ripens its fruit on a s. wall.—*Olea similis* and several other species are useful trees of s. Africa, yielding a very hard and extremely durable wood. Some of them bear the name of Ironwood at the cape of Good Hope. The American Olive (*O. Americana*) is also remarkable for the hardness of its wood. It is found as far n. as Virginia. It is a tree of 30–35 ft. high, with much broader leaves than the common olive. Its fruit is fit for use. Its flowers are fragrant. The Fragrant Olive (*O. fragrans*, or *Osmanthus fragrans*) of China and Japan has extremely fragrant flowers, which are used by the Chinese for flavoring tea.

O'LIVENITE, a mineral consisting chiefly of arsenic acid and protoxide of copper, with a little phosphoric acid and a little water. It is generally of some dark shade of green, sometimes brown or yellow. It is found along with different ores or copper in Cornwall and elsewhere. It is often crystalized in oblique four-sided prisms, of which the extremities are acutely beveled, and the obtuse lateral edges sometimes truncated, or in acute double four-sided pyramids; it is sometimes also spherical, kidney-shaped, columnar, or fibrous.

OLIVEN'ZA, a t. of Spain, near the Portuguese frontier, 19 m. s. by w. from Badajoz, on a small river which flows into the Guadiana. The chief branches of industry are the expressing of oil, weaving, and the making of earthenware. From the treaty for the cession of Olivenza by Portugal to Spain in 1801, Godoy acquired his title of prince of the peace. Pop. 10,000.

OLIVER, ANDREW, 1706–74; b. Boston; educated at Harvard college, and in 1743 elected to the general court, in which he served three terms. He was a member of the council, 1746–65, and secretary of the province, 1756–70. He succeeded Hutchinson as lieut.gov. in 1771. After the passage of the stamp act by parliament in 1765, he took the place of stamp-distributor, but was forced to resign after having been hanged in effigy on the "liberty tree." He was a brother-in-law of Hutchinson, whose political course he followed, and of whose unpopularity he had a full share. The zeal with which he seconded the measures of the British ministry was evident in his letters, which were sent over to this country by Franklin in 1772, and the general court petitioned George III. for his removal.

OLIVER, PETER, LL.D., 1713–91; b. England; brother of Andrew, lieut.gov. of Massachusetts in 1770; graduated at Harvard, 1730. Not regularly bred to the law, he adopted that profession, and on Sept. 14, 1756, was appointed judge of the supreme court, and in 1771 chief-justice. When the colonies assumed control of their own judicial affairs, and sides were taken on the question of loyalty to the crown, he espoused the tory cause, and in Mar., 1774, refused the compensation offered him for his services, when required to give his word not to receive either pay or emolument from any other source than the assembly. He was impeached, and fled from Boston with the British troops in 1776. He was pensioned by the British government, and Oxford, in 1776, conferred upon him the degree of LL.D. His son Peter was a graduate of Harvard, class of 1761, practiced medicine in Middleborough, also returned to England, and died there in 1822, at the age of 80. Peter, the elder, contributed a number of articles to *The Censor*, a tory paper, and published *Speech on the Death of Isaac Lothrop* (1750); *Poem on the Death of Sec. Willard* (1757); *Scriptural Lexicon* (1784–85); new ed. 1832. He transcribed the manuscript history of Wm. Hubbard, and collected many valuable records of the old colony, which he carried with him to England.

OL'IVES, MOUNT OF, called also MOUNT OLIVET, an inconsiderable ridge lying on the e. side of Jerusalem, from which it is only separated by the narrow valley of Jehosaphat. It is called by the modern Arabs Jebel-el-Tur, and takes its familiar name from a magnificent grove of olive-trees which once stood on its western flank, but has now in great part disappeared. The road to mount Olivet is through St. Stephen's gate, and leads by a stone bridge over the now almost waterless brook Cedron. Immediately beyond, at the foot of the bridge, lies the garden of Gethsemane; and the road here parts into two branches, northwards toward Galilee, and eastwards to Jericho. The ridge rises in three peaks, the central one of which is 2,556 ft. above the level of the sea, and 416 ft. above the valley of Jehosaphat. The southern summit is now called "the mount of Offense," and was the scene of the idolatrous worship established by Solomon for his foreign wives and concubines. The northern peak is the supposed scene of the appearance of the angels to the disciples after the resurrection, and is remarkable in Jewish history as the place in which Titus formed his encampment in the expedition against the fated city of Jerusalem. But it is around the central peak, which is the mount of Olives properly so called, that all the most sacred associations of Christian history converge. On the summit stands the church of the Ascension, built originally by St. Helen, the modern church being now in the hands of the Armenian community; and near it are shown the various places where, according to tradition, our Lord wept over Jerusalem, where the apostles composed the apostles' creed, where our Lord taught them the Lord's prayer, etc. Near the church of the Ascension is a mosque and the tomb of a Mohammedan saint. In the garden of Gethsemane, at the foot of the hill, is shown the scene of our Lord's agony. The northern peak spreads out into a plain of considerable extent, which is painfully notable in Jewish history as the place where, after the Jews on occasion of the revolt under Bar-Kochebah, were debarred by Adrian from entering Jerusalem, they were wont to assemble annually on the anniversary of the burning of the temple to celebrate this mournful anniversary, and to take a distant look at their beloved Jerusalem. The scene is beautifully described, and with much dramatic feeling, by St. Jerome.—*Com. in Sophoniam*, t. iii. p. 1665.

OLIVETANS, a religious order of the Roman Catholic church, one of the many remarkable products of that well-known spiritual movement which characterized the 12th and 13th centuries. The Olivetans, or brethern of our lady of mount Olivet, are

an offshoot of the great Benedictine order (q.v.), and derive their origin from John Tolomei, a native of Sienna, born in the year 1272. Tolomei had been a distinguished professor of philosophy in the university of his native city; but his career was suddenly interrupted by the loss of his sight. Although he was cured of his blindness (and, as he himself believed, miraculously), this visitation convinced him of the vanity of earthly things; and in company with some friends he withdrew to a solitary place near Sienna, where he devoted himself to prayer and religious exercises. By the direction of the pope, John XXII., the new brethren adopted the Benedictine rule; but they chose as their especial province the cultivation of sacred science, and the duty of teaching. In the year 1319 Tolomei was chosen as the first general; and even in his lifetime the institute made rapid progress, especially in Italy. It numbered at one time eighty houses, but at present the number is reduced to four—namely, the parent house, so called, of Monte Oliveto, in the diocese of Arezzo in Tuscany, one at Rome, one at Genoa, and one at Palermo. The Olivetan order has produced many distinguished ecclesiastics.

OLIVINE. See CHRYSOLITE.

OL'LA PODRI'DA (literally, *putrid pot*), a Spanish term, originally signifying an accumulation of remains of flesh, vegetables, etc., thrown together into a pot, but generally employed to designate a favorite national dish of the Spaniards, consisting of a mixture of different kinds of meat and vegetables stewed together. It has also come to be figuratively applied to literary productions of very miscellaneous contents. The French equivalent is *pot-pourri*, and the Scotch *hotch-potch*, both of which, but especially the former, are also employed in a figurative sense.

OLLIVIER, EMILE, b. in Marseilles, 1825, son of Démosthène who was exiled from the time of the *coup d'etat* of Napoleon, in 1851, to 1860. Emile was educated for the practice of law; was made commissary-gen. at Marseilles by Ledru Rollin in 1848, and thereafter prefect. In 1849 he resumed the practice of law in Paris; was elected a liberal member of the legislative assembly from Paris in 1857, and re-elected in 1863. In 1867 he was won over to the Bonapartists, and failed of an election in Paris the following year; but secured a seat by an election as deputy from the department of Var. In December of that year Napoleon made him minister of justice under the new constitution of the empire, which office he entered upon Jan. 2, 1870. He was chiefly noted for his subserviency to the policy of the emperor, and his pretensions to statesmanship. He assumed a supercilious confidence in the French military superiority on the breaking out of the German war in 1870, and retired with his master after the first great reverses to French arms Through imperial favor he had been made a member of the French academy in 1870, succeeding to the chair of Lamartine. In 1874 he read a eulogy of Napoleon before the academy, and afterward became its chancellor. He published *Church and State at the Council of the Vatican*, etc.

OLMSTED, a co. in s.e. Minnesota; drained by the Zumbro and Root rivers and their branches; intersected by the St. Peter and Winona railroad; 650 sq.m.; pop. '80, 21,543—16,862 of American birth. The surface is mostly a rolling prairie, and the soil very productive; wheat, oats, hay, and dairy products are the staples. This is the largest wheat producing county in the state. Co. seat, Rochester.

OLMSTED, DENISON, LL.D., 1791–1859; b. Conn.; graduated at Yale College, 1813, and was tutor 1815–17. He was professor of chemistry in the North Carolina university 1817–25; and from that time till his death was connected with Yale, holding a professorship of mathematics until 1836, and after that, of natural philosophy and astronomy. In 1831 he published a treatise on natural philosophy, and in 1840 one on *School Astronomy*, followed in 1841 by the *Compendium of Astronomy*. These text-books came into almost universal use in the colleges of this country, and in an abridged form, in many public schools. They are still used, though in general supplanted by the more modern works of prof. Loomis and others. Profs. Olmsted and Loomis were the first observers of Halley's comet of 1835. He wrote sketches of the lives of sir Humphrey Davy, Roger Sherman, Eli Whitney, pres. Dwight of Yale, and others, and contributed a very large number of scientific and biographical papers to the *American Journal of Science; New Englander; Journal of Commerce*, and many other periodicals.

OLMSTED, FREDERICK LAW, b. Hartford, Conn., 1822; educated there, and at Yale college, making a specialty of agricultural science and engineering. He began life as a farmer and horticulturist; in 1850 traveled on foot through portions of England, Scotland, and the continent, and published, in 1852, a book of observations under the head of *Walks and Talks of an American Farmer in England*, which was replete with information, and widely read. In 1852–53 he traveled in the cotton states, gathering information which was published in 1856 in a book entitled *A Journey in the Seaboard Slave States*. This was followed by a *Journey Through Texas*, 1857, and *A Journey in the Back Country*, in 1860. Abstracts of these works were issued in two vols. in London in 1861 under the title of *The Cotton Kingdom*. In 1855 he was traveling in France, Italy, and Germany, studying especially their parks and horticultural arts. In 1857, when premiums were offered for the best plans for the Central park in New York, Mr. Olmsted associated himself in the preparation of plans with Mr. Calvert Vaux,

partner of A. J. Downing, the distinguished landscape gardener, who was preparing plans for the park when he died. Their combined labors produced the plan which was chosen out of a competition of 34 designs. During the next four years the park was developed under the plans of these gentlemen, in which the most cultivated taste was combined with economy and thoroughness. In 1859 Mr. Olmsted visited Europe to study park works. On the breaking out of the rebellion in 1861 he was appointed by president Lincoln on a commission to investigate the sanitary condition of the U. S. army, and resided for three years in Washington as the business head of the commission. He then spent two years in California, and was made one of the commissioners of the National park of the Yosemite. He returned to New York in 1866 to join Mr. Vaux in the execution of plans for Prospect park in Brooklyn, which they nearly completed under their own supervision. He has since been associated in designs for parks and other public works in Washington, Chicago, San Francisco, Buffalo, and Montreal.

OLMÜTZ, the chief fortress of Moravia, Austria, is the capital of a district of the same name, and is situated in lat. 49° 36′ n., and in long. 17° 15′ e., on an island of the river Moravia, which, by means of sluices, can be opened into the moats, and thus made available for purposes of defense. Olmütz is the see of an archbishop, nominated by the chapter, and is the chief seat of the administrative departments. Its university, founded in 1581, and reorganized in 1827, was reduced to a theological faculty in 1855. Olmütz has a library of 65,000 volumes; good natural history, physical, and other museums; a gymnasium, an archiepiscopal seminary, artillery and infantry academies, polytechnic and other schools, a hospital, an asylum for widows and orphans, etc. The most noteworthy of its churches are the cathedral, a fine old building, and the church of St. Mauritius, completed in 1412, with its celebrated organ, having 48 stops and more than 2,000 pipes. The noble town-hall, with its complicated clock-work, set up in 1574, and the lofty column on the Oberring, with several fine fountains in the squares, and the splendid archiepiscopal palace and chapter-house, all contribute towards the picturesque aspect for which Olmütz is distinguished. The deficiency in public gardens has of late years been in part supplied by the draining and planting of some of the inner moats, and the conversion of some portions of the fortifications into pleasure-grounds. A mile from the city lies the monastery of the Premonstratensians at Hradisch, founded in 1074, now a military hospital. Olmütz has a few manufactories of kerseymere, cloth, linen, and porcelain, and is the seat of an extensive trade in cattle from Poland and Moldavia. Pop. '80, 22,849. Prior to 1777, when Olmütz was raised into an archbishopric, its bishops had long been in the enjoyment of the rank of princes of the empire. The city suffered severely during the thirty years' war, and again in the seven years' war of Silesia, when it more than once fell into the hands of the Prussians. In 1848 Ferdinand I. signed his abdication here in favor of his nephew, Franz-Joseph I.; while in 1850 Olmütz was chosen as the place of conference between the Prussian, Austrian, and Russian plenipotentiaries, for the adjustment of the conflicting differences which had arisen in the German states generally, as the result of the revolutionary movement of 1848.

OLNEY, a t. the co. seat of Richland co., Ill.; on the Grayville and Mattoon, and the Ohio and Mississippi railroads, 130 m. s.e. of Springfield; pop. '80, 3512. There are a court house, bank, 4 hotels, 2 weekly papers, and many churches and schools. The place was settled in 1845.

OLONETZ′, a government in the n. of Russia, bounded on the w. by Finland, and on the e. and n.e. by Archangel. Area, exclusive of water, 49,104 sq. miles. Pop. '80, 314,500. Large lakes abound in this government, the chief, after lake Onega (q.v.), being lakes Wygo and Sego. The surface is in general elevated, and about four-fifths of it are covered with wood. The soil is sterile, and the climate is cold and damp. The wealth of the government consists principally in its minerals. Its iron mines supply the iron-works of Petrasowodsk, and from its quarries marbles are sent to St. Petersburg. The principal employments of the inhabitants, who are principally Russians and Finns, and belong to the Greek church, are carving in wood, fishing, and hunting. Many of them also are employed in the iron-works and quarries. The women weave and spin. The government derives its name from the small but ancient town of Olonetz. Petrasowodsk is the center of administration.

OLORON, or OLORON-SAINTE-MARIE, a t. of France, in the department of Basses-Pyrénées, on the Gave d'Oloron, 15 m. s.w. of Pau. The church of St. Marie is in the transition style from Romanesque to Gothic. The principal articles of manufacture are the checkered handkerchiefs which form the favorite head-dresses of the peasantry of Aragon and Gascony, and also the "barrets" or caps of the Béarnais. Pop. '76, 7,223.

O′LOT, a t. of Spain, in the province of Gerona, and 22 m. n.w. from Gerona, near the base of the Pyrenees, on the Fluvia. There are 14 volcanic cones close to the town; the crater of the largest is a mile in circumference and 445 ft. in depth. The whole district is volcanic. In many places, and even in the town itself, currents of air blow continually from the porous lava. These are called *bufadores* and *sopladores*, and some of them are conducted beneath houses, and used as refrigerators in hot weather. They maintain the temperature of about 53° F. both in hot and cold weather, but the gust of air is strongest in hot weather. Olot was almost destroyed by an earthquake in 1421, but was soon rebuilt. Pop. 12,070.

OLS'HAUSEN, HERMANN, 1796–1839; b. Oldesloe, in the duchy of Holstein. He studied theology in 1814–18 at Kiel and Berlin, hearing at the former the lectures of Twesten, and at the latter those of Neander and Schleiermacher. His first work was a prize-essay, *Melanchthon's Characteristik aus seinen Briefen dargestellt.* He became in 1818 licentiate in theology in the university; in 1821 was elected professor extraordinary at Königsberg, and in 1827 a regular professor. In 1834 he accepted a theological professorship at Erlangen, where he died at the early age of forty-three. Besides his prize essay he published *Historiæ eccles. veteris monumenta; Die Aechtheit der vier Kanonischen Evangelien aus der Geschichte der zwei ersten Jahrhunderte erwiesen; Ein Wort über tieferen Schriftsinn; Die Bibl. Schriftauslegung; Noch ein Wort über tieferen Schriftsinn.* In this last work he rejects a literal verbal inspiration of the Scriptures. His most valued work is his commentary on the New Testament, translated into English for Clark's foreign theological library, and revised and reprinted with Olshausen's tract on the *Genuineness of the Writings of the New Testament,* by prof. A. C. Kendrick, of Rochester university, 6 volumes.

OLYM'PIA, the scene of the celebrated Olympic games (q.v.), is a beautiful valley in Elis, in the Peloponnesus, through which runs the river Alpheus. As a national sanctuary of the Greeks, Olympia contained, within a small space, many of the choicest treasures of Grecian art belonging to all periods and states, such as temples, monuments, altars, theaters, and multitudes of images, statues, and votive-offerings of brass and marble. In the time of the elder Pliny, there still stood here about 3,000 statues. The Sacred grove (called the *Altis* of Olympia, inclosed a level space about 4,000 ft. long by nearly 2,000 broad, containing both the spot appropriated to the games and the sanctuaries connected with them. It was finely wooded, and in its center stood a clump of sycamores. The Altis was crossed from w. to e. by a road called the "Pompic way," along which all the processions passed. The Alpheus bounded it on the s., the Cladeus, a tributary of the the former, on the w., and rocky but gently swelling hills on the n.; westward it looked towards the Ionian sea. The most celebrated building was the *Olympieium,* or *Olympium,* dedicated to Olympian Zeus. It was designed by the architect Libon of Elis in the 6th c. B.C., but was not completed for more than a century. It contained a colossal statue of the god, the masterpiece of the sculptor Phidias, and many other splendid figures; its paintings were the work of Panænus, a relative of Phidias. Next to the Olympieium ranked the *Heræum,* dedicated to Hera, the wife of Zeus, and the queen of Heaven, containing the table on which were placed the garlands prepared for the victors in the games; the *Pelopium,* the *Metroum,* the ten *Thesauri* or treasuries, built for the reception of the dedicatory offerings of the Greek cities, the temples of Eileithyia and Aphrodite also deserve mention; the *Stadium* and the *Hippodrome,* where the contests took place, stood at the eastern end of the Altis. The plowshare now passes through the scene of these contests, but many ruins still attest the ancient magnificence of the buildings. In 1875 explorations, at the expense of the German government, were undertaken at Olympia, and already several important "finds" have been made.

OLYMPIA, the capital city of Washington territory, in Thurston co., at the s. part of Puget sound, about 100 m. n by w. of Portland, Oregon, in lat. 47° 10′ n., long. 123° w.; pop. '85, 2,500. The Des Chutes river, which enters the sound at this point, is spanned by a bridge 520 ft. long from Olympia to Tumwater, and there is a bridge over 2,000 ft. long across the inlet. The nearest railroad station is Tenino, 15 m. s., on the Northern Pacific railroad. The surrounding country is covered with forests, and lies between the Coast and Cascade mountains. The streets are wide and regularly laid out, bordered with shade trees, and lined with handsome residences, many of which are inclosed by gardens. Among the public buildings are the state-house, court-house, and city hall. There are 4 hotels, 8 churches, a bank, 2 academies, and 2 libraries. There are 3 or 4 newspapers. Boots and shoes, flour, soap, beer, and lumber are manufactured. The Des Chutes furnishes ample water-power. Steamers run almost daily to Victoria and other points on Puget sound, and a line of stages to the railroad station at Tenino. Large vessels can come up the inlet to Olympia at high tide; but low tide uncovers a long mud flat which prevents even small boats from reaching the wharf. The difference between extreme high and low tides here is 24 ft., and the average ebb and flow 9.2 feet. Olympia was surveyed in 1851; made a city, 1859.

OLYMPIAD (Gr. *olympias*), the name given to the period of four years that elapsed between two successive celebrations of the Olympic games (q.v.); a mode of reckoning which forms the most celebrated chronological era among the Greeks. The first recorded dates from July 21 or 22, 776 B.C., and is frequently referred to as the Olympiad of Corœbus; for historians, instead of referring to the olympiad by its number, frequently designate it by the name of the winner of the foot-race in the Olympic games belonging to that period, though at times both the number and the name of the conqueror are given. A slight indefiniteness is frequently introduced into Greek chronology, from the custom of mentioning only the olympiad, neglecting to specify in which year of the olympiad a certain event happened. As this era commenced in 776 B.C., the first year of our present era (1 A.D.) corresponded to the last half of the fourth year of the 194th with the first half of the first year of the 195th olympiad, and 394 A.D. corresponds to the second year of the 293d olympiad, at which time reckoning by olympiads terminated. This era is used

only by writers, and is never found on coins, and very seldom on inscriptions. Another olympic era, known as the "New Olympic Era," was commenced by the Roman emperors, and dates from 131 A.D.; it is found both in writings, public documents, and inscriptions.

OLYMPIAS, the wife of Philip II., king of Macedon, and mother of Alexander the great. She was the daughter of Neoptolemus I., king of Epirus. She possessed a vigorous understanding, but was of a most passionate, jealous, and ambitious character. Philip having, on account of disagreements, separated from her and married Cleopatra, niece of Attalus (337 B.C.), she went to reside with her brother Alexander, king of Epirus, where she incessantly fomented intrigues against her former husband, and is believed to have taken part in his assassination by Pausanias, 337 B.C. On the accession of her son Alexander to the throne, she returned to Macedonia, where she contributed to bring about the murder of Cleopatra and her daughter. Alexander was filled with indignation, but Olympias was his mother, and he could not obey the dictates of justice. During his brief but magnificent career he always treated her with the utmost reverence and esteem, though he never allowed her to meddle with his political schemes. After his death she endeavored to get possession of the vacant throne, and obtained the support of Polysperchon in her designs. In 317 the two defeated Arrhidæus, the weak-minded step-brother and successor of Alexander, and his wife Eurydice, whom she caused to be put to death in the same year. She now began to glut her revenge on such of the Macedonian nobles as had shown themselves hostile to her; but her cruelties soon alienated the minds of the people from her, even though she was the mother of their heroic king, whereupon Cassander (q.v.), her principal adversary, marched n. from the Peloponnesus, besieged her in Pydna, and forced her to surrender in the spring of 316 B.C. She was immediately afterward put to death. Olympias was a woman of heroic spirit, but of fierce and uncontrollable passions, and in the perpetration of crime, when she reckoned it necessary, displayed an unscrupulousness peculiarly feminine.

OLYMPIC GAMES, the most splendid national festival of the ancient Greeks, were celebrated every fifth year in honor of Zeus, the father of the gods, on the plain of Olympia (q.v.). Their origin goes back into prehistoric ages. According to the myth elaborated or preserved by the Elean priests, they were instituted by the Idæan Herakles in the time of Kronos, father of Zeus; according to others, by the later Herakles, son of Zeus and Alkmene; while Strabo, rejecting the older and more incredible legends, attributes their origin to the Herakleidæ after their conquest of the Peloponnesus. But the first glimpse of anything approaching to historic fact in connection with the games is their so-called revival by Iphitos, king of Elis, with the assistance of the Spartan lawgiver, Lycurgus, about 884 B.C.; or, according to others, about 828 B.C., an event commemorated by an inscription on a disk kept in the *Heræum* at Olympia, which Pausanias (flor. 2d c. A.D.) saw. That festive games were celebrated here—in other words, that Olympia was a sacred spot long before the time of Iphitos, can indeed hardly be doubted: the universal tradition that the Elean king had only "revived" the games proves this; but nothing whatever can be historically ascertained concerning their origin, character, or frequency, in this remoter time. Iphitos may, therefore, be regarded as their founder, yet the reckoning of time by olympiads (q.v.)—the real dawn of the historical period in Greek history—did not begin till more than a century later. At first, it is conjectured, only Peloponnesians resorted to the Olympic games, but gradually the other Greek states were attracted to them, and the festival became *Panhellenic*. Originally, and for a long time, none were allowed to contend except those of pure Hellenic blood; but after the conquest of Greece by the Romans, the latter sought and obtained this honor, and both Tiberius and Nero figure in the list of Roman victors. Women—with one exception, the priestess of Demeter Chamyne—were forbidden to be present, on pain of being thrown headlong from the Typæan rock. The games were held from the 11th to the 15th of the Attic month *Hekatombaeon* (our July–August), during which, first throughout Elis, and then throughout the rest of Greece, heralds proclaimed the cessation of all intestine hostilities; while the territory of Elis itself was declared inviolable. The combatants were required to undergo a preparatory training for 10 months in the gymnasium at Elis, and during the last of these months the gymnasium was almost as numerously attended as the games themselves. Much uncertainty prevails as to the manner in which the contests were distributed over the different days. Krause (*Olympia*, p. 106) suggests the following order: On the first day the great initiatory sacrifices were offered, after which the competitors were properly classed and arranged by the judges, and the contests of the trumpeters took place; the second day was set apart for the boys who competed with each other in foot-races, wrestling, boxing, the *pentathlon*, the *pankration*, horse-races; the third and principal day was devoted to the contests of men in foot-races of different kinds (as, for example, the simple race, once over the course; the *diaulos*, in which the competitors had to run the distance twice; and the *dolichos*, in which they had to run it seven or twelve times); wrestling, boxing, the *pankration* (in which all the powers and skill of the combatants were exhibited), and the race of *hoplites*, or men in heavy armor; on the fourth day came off the *pentathlon* (contest of five games —viz., leaping, running, throwing the discus, throwing the spear, and wrestling), the chariot and horse races, and perhaps the contests of the heralds; the fifth day was set

apart for processions, sacrifices, and banquets to the victors (called *Olympionikoi*), who were crowned with a garland of wild olive twigs cut from a sacred tree which grew in the Altis (see OLYMPIA), and presented to the assembled people, each with a palm branch in his hand, while the heralds proclaimed his name, and that of his father and country. On his return home, he was received with extraordinary distinction; songs were sung in his praise (14 of Pindar's extant lyrics are devoted to *Olympionikoi*); statues were erected to him, both in the Altis and in his native city; a place of honor was given him at all public spectacles; he was in general exempted from public taxes, and at Athens was boarded at the expense of the state in the Prytaneion.

The regulation of the games belonged to the Eleans, from whom were chosen the *hellanodikai*, or judges, whose number varied. At first there were only two, but as the games became more and more national, and consequently more numerous, they were gradually increased to ten, sometimes even to twelve. They were instructed in their duties for ten months beforehand at Elis, and held their office only for one year. The officers who executed their commands were called *alytia*, and were under the presidency of an alytarch.—See Crause's *Olympia oder Darstellung der grossen Olympischen spiele* (Wien, 1838.)

OLYMPIODO'RUS, one of the latest of the Alexandrian Neoplatonists, flourished in the first half of the 6th c. after Christ, during the reign of the emperor Justinian. Regarding his life nothing is known. Of his writings, we possess a *Life of Plato*, with commentaries or scholia on several of his dialogues, the Gorgias, Philebus, Phædo, and Alcibiades I. In these he appears as an acute and vigorous thinker, and as a man of great erudition. Olympiodorus's *Life of Plato* was published by Wetstein (1692), Etwall (Lond. 1771), and Fischer (Leips. 1783); the best edition of the scholia is that of Mystoxides and Schinas (Venice, 1816).

OLYMPUS, the ancient name of several mountains or chains of mountains—*e.g.*, of the north-western continuation of Taurus in Mysia, of a mountain in the island of Cyprus, of one in Lycia, of another in Elis, of one on the borders of Laconia and Arcadia, and of another on the frontiers of Thessaly and Macedonia. Of these, the last-mentioned (now called *Elymbo*) is the most famous. Its eastern side, which fronts the sea, is composed of a line of vast precipices, cleft by ravines, filled with forest-trees. Oak, chestnut, beech, plane tree, are scattered abundantly along its base, and higher up appear great forests of pine, as in the days of the old poets of Greece and Rome. With Euripides, it is *poludendros Olympos;* with Virgil, *frondosus Olympus;* and with Horace, *opacus Olympus.* Its highest peak is 9,754 ft. above the level of the sea, and is covered with snow for about nine months of the year. It was regarded by the ancient Greeks as the chief abode of the gods, and the palace of Zeus was supposed to be upon its broad summit. According to Greek legend, it was formerly connected with Ossa, but was separated from it by an earthquake, allowing a passage for the Peneius through the narrow vale of Tempe to the sea. The philosophers afterwards transferred the abode of the gods to the planetary spheres, to which they likewise transferred the name of Olympus.

OLYNTHUS, an ancient city of Macedonia, situated on the Toronäic gulf. It was probably founded by the Eubœan Etrurians and Chalcidians. At the time of the second Persian invasion the town was captured and sacked by Artabazus, one of Xerxes's generals. When Brasidas overthrew the Athenian power in Chalcidice, Olynthus gradually gained importance and became the head of an alliance among the northern Greek states, which soon provoked the jealousy of Athens and Lacedæmonia. When the annexation of Appollonia and Acanthus was threatened by Olynthus, 383 B.C., an army of 10,000 men was sent against that republic by the Peloponnesian states, under the command of Teleutias, a Spartan. The Olynthians were driven back into their city; but, in a sortie, surprised the enemy and threw them into a panic. Teleutias being killed while trying to rally his forces. Agesipolis then took command, and had gained the advantage, when he died, and Polybiades, his successor, compelled the surrender of the city in 379 B.C. The confederation was broken up. For some time they had an alliance with Philip of Macedonia; but, two years after they had completed a league with Athens, 352 B.C., war broke out between Olynthus and Macedonia. It was in advocacy of the policy of supporting the Olynthians that Demosthenes uttered the Olynthiacs, among the best of his orations. Some aid was sent by Athens, but it was totally inadequate, and in 347 B.C. Philip razed the city to the ground and sold the inhabitants as slaves.

OM is a Sanskrit word which, on account of the mystical notions that even at an early date of Hindu civilization were connected with it, acquired much importance in the development of Hindu religion. Its original sense is that of emphatic or solemn, affirmation or assent. Thus, when in the White-Yajur-Veda (see VEDA) the sacrificer invites the gods to rejoice in his sacrifice, the god Savitr'i assents to his summons by saying: "*Om* (i.e., be it so); proceed!" Or, when in the Br'had-âranyaka-Upanishad, Prajâpati, the father of gods, men, and demons, asks the gods whether they have understood his instruction; he expresses his satisfaction with their affirmative reply, in these words: "*Om*, you have fully comprehended it;" and, in the same Upanishad, Pravâhan'a answers the question of S'wetaketu, as to whether his father has instructed him, by uttering the word "*Om*," i.e., "forsooth (I am)." A portion of the R'igveda, called the Aitareya-Brâhman'a, where describing a religious ceremony at which verses from

the R'igveda, as well as songs called Gâthâs, were recited by the priest called Hotr'i, and responses given by another priest, the Adhwaryu, says: "*Om* is the response of the Adhwaryu to the R'igveda verses (recited by the Hotr'i), and likewise *tathâ* (i.e., thus) his response to the Gâthâs, for *Om* is (the term of assent) used by the gods, whereas *tathâ* is (the term of assent) used by men" (the R'igveda verses being, to the orthodox Hindu, of divine, and the Gâthâs of human, authorship). In this, the original sense of the word, it is little doubtful that *om* is but an older and contracted form of the common Sanskrit word *evam*, "thus," which, coming from the pronominal base "*a*"—in some derivations changed to "*e*"—may have at one time occurred in the form *avam*, when, by the elision of the vowel following *v*—for which their are numerous analogies in Sanskrit—*avam* would become *aum*, and hence, according to the ordinary phonetic laws of the language, *om*. This etymology of the word, however, seems to have been lost, even at an early period of Sanskrit literature; for another is met with in the ancient grammarians, enabling us to account for the mysticism which many religious and theological works of ancient and mediæval India suppose to inhere in it. According to this latter etymology, *om* would come from a radical *av* by means of an affix *man*, when *om* would be a curtailed form of *avman* or *oman;* and as *av* implies the notion of "protect, preserve, save," *om* would be a term implying "protection or salvation;" its mystical properties and its sanctity being inferred from its occurrence in the Vedic writings, and in connection with sacrificial acts, such as are alluded to before.

Hence *Om* became the auspicious word with which the spiritual teacher had to begin, and the pupil had to end each lesson of his reading of the Veda. "Let this syllable," the existing Prâtis'âkhya, or grammar of the R'igveda, enjoins, "be the head of the reading of the Veda, for, alike to the teacher and the pupil, it is the supreme Brahman, the gate of heaven." And Manu (q.v.) ordains: "A Brahman, at the beginning and end (of a lesson on the Veda), must always pronounce the syllable *Om;* for unless *Om* precede, his learning will slip away from him; and unless it follow, nothing will be long retained." At the time when another class of writings, the Purân'as (q.v.), were added to the inspired code of Hinduism, for a similar reason, *Om* is *their* introductory word.

That the mysterious power which, as the foregoing quotation from the law-book of Manu shows, was attributed to this word, must have been the subject of early speculation, is obvious enough. A reason assigned for it is given by Manu himself. "Brahmâ," he says, "extracted from the three Vedas the letter *a*, the letter *u*, and the letter *m* (which combined result in *Om*), together with the (mysterious) words *Bhûh'* (earth), *Bhuvah'* (sky), and *Swah'* (heaven);" and in another verse: "These three great immutable words, preceded by the syllable *Om*, and (the sacred R'igveda verse, called) Gâyatrî, consisting of three lines, must be considered as the mouth (or entrance) of Brahman (the Veda)"—or, as the commentators observe—the means of attaining final emancipation; and "The syllable *Om* is the supreme Brahman, (three) regulated breathings (accompanied with the mental recitation of Om, the three mysterious words, Bhûh', Bhuvah', Swah', and the Gâyatri), are the highest devotion. . . . . All rites ordained in the Veda, such as burnt and other sacrifices, pass away; but the syllable *Om* must be considered as imperishable, for it is (a symbol of) Brahman (the supreme Spirit) himself, the Lord of Creation." In these speculations, Manu bears out, and is borne out by, several Upanishads. See VEDA. In the *Katha-Upanishad*, for instance, *Yama*, the god of death, in replying to a question of Nachiketas, says: "The word which all the Vedas record, which all the modes of penance proclaim, of which desirous the religious students perform their duties, this word I will briefly tell thee, it is *Om*. This syllable means the (inferior) Brahman and the supreme (Brahman). Whoever knows this syllable, obtains whatever he wishes." And in the *Pras'na-Upanishad*, the saint Pippalâda says to Satyakâma: "The supreme and the inferior Brahman are both the word *Om;* hence the wise follows by this support the one or the other of the two. If he meditates upon its one letter (*a*) only, he is quickly born on the earth; him carry the verses of the R'igveda to the world of man; and if he is devoted there to austerity, the duties of a religious student, and faith, he enjoys greatness. But, if he meditates in his mind on its two letters (*a* and *u*), he is elevated by the verses of the Yajur-Veda to the intermediate region; he comes to the world of the moon, and having enjoyed there power, returns again (to the world of man). If, however, he meditates on the supreme Spirit by means of its three letters (*a*, *u*, and *m*), he is produced in light, in the sun; as the snake is liberated from its skin, so he is liberated from sin." According to the Mân'd'ûkya-Upanishad, the nature of the soul is summarized in the three letters *a*, *u*, and *m*, in their isolated and combined form—*a* being Vais'wânara, or that form of Brahman which represents the soul in its waking condition; *u*, Taijasa, or that form of Brahman which represents the soul in its dreaming state; and *m*, Prâjna, or that form of Brahman which represents it in its state of profound sleep (or that state in which it is temporarily united with the supreme Spirit); while *a*, *u*, *m*, combined, i.e., Om, represent the fourth or highest condition of Brahman, "which is unaccountable, in which all manifestations have ceased, which is blissful and without duality. *Om*, therefore is soul; and by this soul, he who knows it enters into (the supreme) soul." Passages like these may be considered as the key to the more enigmatic expressions used, for instance, by the author of the *Yoga* (q.v.) philosophy, where, in three short sentences, he says: "His (the supreme Lord's name) is *Pran'ava* (i.e., *Om*); its muttering (should be made) and reflection on its

signification; thence comes the knowledge of the transcendental spirit and the absence of the obstacles" (such as sickness, languor, doubt, etc., which obstruct the mind of an ascetic). But they indicate, at the same time, the further course which superstition took in enlarging upon the mysticism of the doctrine of the Upanishads. For as soon as every letter of which the word *Om* consists was fancied to embody a separate idea, it is intelligible that other sectarian explanations were grafted on them, to serve their special purposes. Thus while S'ankara, the great theologian and commentator on the Upanishads, is still contented with an etymological punning, by means of which he transforms "*a*" (or rather "*â*") into an abbreviation of *âpti* (pervading), since speech is pervaded by Vais'wânara; "*u*" into an abbreviation of *utkarsha* (superiority), since Taijasa is superior to Vais'wânara; and "*m*" into an abbreviation of *miti* (destruction), Vais'wânara and Taijasa, at the destruction and regeneration of the world, being, as it were absorbed into Prâjna—the Purân'as (q.v.) make of "*a*" a name of Vishn'u; of "*u*," a name of his consort *S'rî;* and of "*m*," a designation of their joint-worshipper; or they see in *a*, *u*, *m*, the Triad, Brahmâ, Vishn'u, and S'iva; the first being represented by "*a*," the second by "*u*," and the third by "*m*"—each sect, of course, identifying the combination of these letters, or Om, with their supreme deity. Thus, also, in the Bhagavadgîrâ, which is devoted to the worship of Vishn'u in his incarnation as Kr'ishn'a, though it is essentially a poem of philosophical tendencies, based on the doctrine of the Yoga, Kr'ishn'a in one passage says of himself that he is *Om;* while, in another passage, he qualifies the latter as the supreme Spirit.—A common designation of the word *Om*—for instance, in the last named passages of the Bhagavadgîtâ—is the word *Pran'ava*, which comes from a so-called radical *nu*, "praise," with the prefix *pra*, amongst other meanings, implying emphasis, and therefore literally means "eulogium, emphatic praise." Although *Om*, in its original sense, as a word of solemn or emphatic assent, is, properly speaking, restricted to the Vedic literature, it deserves notice that it is nowadays often used by the natives of India in the sense of "yes," without, of course, any allusion to the mystical properties which are ascribed to it in the religious works. See also the article Om Man'i Padme Hûm'.

That there exists no connection whatever, as has been supposed by some writers to be the case, between *Om* and *Amen*, requires scarcely any remark, after the etymological explanations given above; but it may not be without interest to observe that, though the derivation of *Om*, as a curtailment of *av-man*, from *av*, "protect, save," is probably merely artificial, and, as stated before, invented to explain the later mystical use of the Vedic word, it seems more satisfactory to compare the Latin *omen* with a Sanskrit *avman*, "protection," as derived by the grammarians from *ăv* (in the Latin *ăve-o*), than to explain it in the fashion of the Roman etymologists: "Omen, quod ex ore primum elatum est, osmen dictum;" or, "Omen velut oremen, quod fit ore augurium, quod non avibus aliove modo fit." And since *pra-nava*, from Sanskrit *nu*, "praise," is, like *Om*, used in the sense of "the Deity," it is likewise probable that *numen* does not come, as is generally believed, from Latin *nu-(ere)*, "nod," but from a radical corresponding with the Sanskrit *nu*, "praise."

OMAGH (Irish, *Oigh magh*, "Seat of the chiefs"), an ancient t., capital of the co. of Tyrone in Ireland, situated on the river Strule, distant 34 m. s. from Londonderry, and 110 m. n.n.w. from Dublin, with both which cities it is connected by railway. Omagh grew up around an abbey founded in the year 792, but is first heard of as a fortress of Art O'Nial in the end of the 15th c., about which time it was forced to surrender to the English, although its possession long continued to alternate between Irish and English hands. It formed part of James I.'s "Plantation" grants, and was strongly garrisoned by Mountjoy. On its being evacuated by the troops of James II. in 1689, it was partially burned, and a second fire in 1743 completed its destruction. But has it been well rebuilt, and is now a neat and prosperous town. Pop. 81, 4,126. Omagh contains a very handsome court-house, where the assizes for county Tyrone are held, several neat churches (Roman Catholic, Episcopal, and Presbyterian), a convent, several partially endowed and national schools, a district lunatic asylum, and the work-house of the Poor-Law Union of which it is the center. There is also a barrack station—it being within the Belfast military district. Its trade is chiefly in brown linens, corn, and agricultural produce.

O'MAHA, the chief city of the state of Nebraska, is on the right bank of the Missouri, opposite Council Bluffs, and 20 m. n. of the mouth of the Nebraska river. Besides the government offices, it has a large trade by the rivers, and across the prairies, and is the eastern terminus of the Union Pacific railway, and also of the Omaha and North-western, and the Omaha and South-western lines. Pop. in 1860, 1912; in 1870, 16,083.

O'MAHA (*ante*), the chief city of Nebraska, though not its capital, on the w. bank of the Missouri river, lat. 41° 30′ n. and long. 96° w. of Greenwich. Its site is upon a hilly plateau from 50 to 150 ft. above the river, and 950 ft. above the level of the sea, with planes fairly adapted to city improvements. Its name is derived from one of the tribes of Dakota Indians. The t. was laid out in 1854, became an incorporated city in 1859, and was platted on a scale of magnitude that anticipated the growth of a great city. The territorial capital was first located here, but was subsequently fixed at the city of

Lincoln. It is the county seat of Douglass county. Omaha is 490 m. westerly by rail from Chicago; pop. '60, 1883; '70, 16,083; '80, 30,518. Before the construction of the Union Pacific road, which began at this point, it was the most northerly outfitting place for overland trains to the "far west."

The aid of the government in the construction of the Union Pacific railway, and the choice of Omaha as its starting point on the Missouri in 1864, made it the theater of great speculation in the belief that it was destined to an extraordinary growth. Its growth has in fact been rapid, though less so than was anticipated by some enthusiasts. It now has connections by the Union bridge across the Missouri, connecting it with the city of Council Bluffs on the e. side, with a great radiating system of railways to all points eastward, and with the country to the n., w., and s., by other roads of which it is the terminus.

The city is lighted with gas, has several street railway lines, a U.S. court-house and post office, which is the finest building in the city, and in which the U.S. court for the district of Nebraska sits; large and excellent school buildings, extensive railway structures, hotels, the state institution for the deaf and dumb, and many elegant residences and business houses. Its wholesale trade in 1875 amounted to $9,500,000. It had, 1884, 6 national banks, with capital of $1,200,000; individual deposits, $4,310,251. It has extensive iron works for making and rolling railroad iron, machine shops, and one of the most complete establishments in the country for smelting, separating, and refining the ores of gold, silver, copper, lead, and zinc; which come to Omaha to be treated from the mining regions of all the territories along the line of the Union Pacific and Central Pacific railways. The city has 3 daily and 6 weekly newspapers, 3 monthlies, 24 churches, 2 colleges (one, medical), and a collegiate school for girls.

OMAHAS, an Indian tribe of the Dakota family, living when visited by the early explorers along the St. Peter's river, divided into two tribes, Ishtasundas and Hongashanos, and 13 clans, one of which had charge of a sacred shell, kept in a temple. One of their customs forbade a man's speaking with his father-in-law or mother-in-law. They could, at one time, muster 700, but in 1802 small-pox had reduced their number to 300. They now left their settlements and for some years led a roving life, constantly harassed by the Sioux. The explorers Lewis and Clarke found them in 1805 living along the Quicoure river. Their number was then 600. Between 1815 and 1854, they ceded large portions of their lands. Missions were established among them in 1839, and again in 1846, but met with little success. They had succeeded in making a permanent treaty of peace with the Poncas and Pawnees in 1800, but were continually at war with the Sioux, who several times forced them to withdraw to the Elkhorn. In 1843 they negotiated a treaty of peace with some of the Sioux, and went back to their old settlements. The most famous of their chiefs, Logan Fontanelle, was slain by the Sioux in 1855. For the last generation they have followed agriculture, and have been more prosperous; and their number has increased to about 1167. They have established schools and a church, and hold property valued at $75,000. They live on an extensive reservation in Blackbird co., Nebraska.

OMAN', the most eastern portion of Arabia, a strip of maritime territory, extending between Ras-el-Jiboul and Ras-el-Had, bounded on the n.e. by the gulf of Oman, and on the s.w. by the deserts of the interior. It is about 370 m. in length; its greatest breadth is 120 miles. At a distance of from 20 to 40 m. from the coast, a chain of mountains runs parallel to it, which reaches in its highest ridge, called *Gebel Achdar* ("Great Mountain"), an elevation of 6,000 ft.; the average height is 4,000 feet. There are a few not inconsiderable streams, and some richly fertile tracts in this region, but the greater part is a waste of sand, with here and there a small oasis, where, however, the vegetation is most luxuriant. Groves of almond, fig, and walnut-trees, tower to an enormous height, overshadowing the orange and citron trees, but are themselves overtopped by the splendid date-palms. The most powerful state of Oman is *Muscat* (q.v.).

OMAR, Abû-Hafsa-ibn-al-Khettab, the second caliph of the Moslems, was b. about 581. His early history is little known, but previous to his conversion he was an ardent persecutor of Mohammed and his followers. After his conversion he became as zealous an apostle as he had formerly been a persecutor, and rendered valuable aid to the prophet in all his warlike expeditions. After Mohammed's death, he casused Abu-bekr to be proclaimed caliph, and was himself appointed *haujeb*, or prime-minister. Though of a fiery and enthusiastic temperament, he proved a sagacious adviser, and it was at his suggestion that the caliph put down with an iron hand the many dissensions which had arisen among the Arabs after the prophet's decease, and resolved to strengthen and consolidate their new-born national spirit, as well as propagate the doctrines of Islam, by engaging them in continual aggressive wars. On the death of Abu-bekr, Omar, succeeded as caliph, and pushed on the wars of conquest with increased vigor. He was summoned to Jerusalem in 637, to receive the keys of that city, and before leaving gave orders to build a mosque, now called by his name, on the site of the temple of Solomon. Omar now took the command of a portion of the army, and reduced the other chief cities of Palestine. He then planned an invasion of Persia, which was commenced the same year, and by 642 the whole of what is now known as Persia was subdued. In the meantime the war in Syria was vigorously prosecuted, and the Byzantine armies,

repeatedly defeated, at length gave up the contest. In 639, Amrû, one of his generals, had invaded Egpyt with a considerable force; but such was the prestige of the Arabs, or the incapacity of the lieutenants of the emperor Heraclius, that this valuable country, with its six millions of people, was reduced under the caliph's authority without a single contest, and only two towns, Misr and Alexandria, were even attempted to be defended. (For the story which was till lately believed concerning the destruction of the Alexandrian library, see ALEXANDRIAN LIBRARY.) Barca and Tripoli were next subdued by Amrû. On the n., Armenia was overrun in 641, and the caliph's authority now reached from the desert of Khiva to the Syrtis, an enormous extension in ten years. In 644 Omar was assassinated in the mosque of Medina by a Persian slave from motives of revenge. He languished five days after receiving the wound, but refused to appoint a successor, and named six commissioners who were to choose one from themselves. He was buried in the mosque of Medina, near the prophet and Abu-bekr, and his tomb is still visited by pilgrims.

Omar may be called the founder of the Mohammedan power, as from a mere sect he raised it to the rank of a conquering nation, and left to his successor an empire which Alexander the great might have envied. In him we find a rare combination of qualities, the ardent zeal of the apostle side by side with the cautious foresight and calm resolution of the monarch. His great military talents, and severity to "obstinate unbelievers," rendered him formidable to his enemies, and his inexorable justice rendered him no less obnoxious to the more powerful of his subjects, and gave rise to many attempts at his assassination. Omar was the founder of many excellent institution; he assigned a regular pay to his soldiers, established a night-police in towns, and made some excellent regulations for the more lenient treatment of slaves. He also originated the practice of dating from the era of the *Hedjrah* (q.v.). He assumed the title of *Emir-al mumenin* ("Commander of the Faithful") in preference to that of *Khalifah-rasouli-Ilahi*, the ordinary designation; and to the present day his name is held in the greatest veneration by the orthodox or Sunî sect of Moslems.

OMAR PASHA, a celebrated Turkish general, was b. at Plaski, an Austrian village in the Croatian military frontier, in 1806 (according to some authorities, in 1811). His real name was Mikail Lattas, and his father being an officer in the Austrian army, Mikail was educated at the military school of Thurn, near Carlstadt, where he greatly distinguished himself. He afterward joined one of the frontier regiments as a cadet, and was employed as secretary by the military inspector of roads and bridges; but having by some breach of discipline rendered himself amenable to punishment, he fled to Bosnia, where he became book-keeper to a Turkish merchant, and embraced Mohammedanism. He was next employed by Hussein Pasha, the governor of Widin, as tutor to his sons; and in 1834 was sent in charge of them to Constantinople, where his beautiful calligraphy gained for him the post of writing-master in the military school. Omar Effendi (as he was now called) was next appointed writing-master to Abdul-Medjid, the heir to the throne, and received the honorary rank of capt. in the Turkish army, and the hand of a rich heiress. On his pupil's accession in 1839, Omar was raised to the rank of col., and sent to Syria to aid in the suppression of disturbances which had broken out in that province, and in 1842 he was appointed military governor of the Lebanon district. The severity of his rule did not hinder the Maronites from desiring to have him as chief of the mountain; but in the following year he was recalled, received the title of pasha, and was sent, along with Redschid Pasha, against the revolted Albanians. The skill and energy with which he suppressed this insurrection, as well as others in Bosnia and Kurdistan, raised him high in favor with the sultan. Toward the end of 1852 he opened the campaign against the Montenegrins, who were being rapidly subdued, when Austria interfered and compelled a treaty. On the invasion of the principalities by the Russians (July 1853), Omar collected at Schumla an army of 60,000 men to cover Constantinople; but being no less a politician than a soldier, he soon divined that the Russians would not immediately cross the Danube, and accordingly pushed on to Widin, where he crossed the river in presence of the enemy and intrenched himself at Kalafat. Another part of the Turkish army moved down the Danube to Turtukai, near Silistria, crossed the river at that place, and intrenched themselves at Oltenitza. On Nov. 4, the latter division were attacked by 9,000 Russians, whom they totally defeated with a loss of nearly 4,000 men and almost all their officers. The Russians also received two severe checks at Kalafat, on Jan. 6, and March 15, 1855. Omar kept up the spirit of his troops by occasional successful skirmishes with the Russians, and threw a garrison of 8,000 men into Silistria. In the following spring the Russians passed the Danube at two points, and laid siege to Silistria (q.v.), but their assaults were invariably repulsed with severe loss. The Russians then withdrew from the principalities, and Omar entered Bucharest in triumph in August, 1854. On Feb. 9, 1855, he embarked for Eupatoria, where, on the 17th of the same month, he was suddenly attacked by 40,000 Russians, who were repulsed with great loss. He was soon afterward (Oct. 3, 1855) sent to relieve Kars, but arrived too late, and the armistice which followed (Feb. 29, 1856) put a stop to his military career. He was subsequently made governor of Bagdad; but having been accused of maladministration, was banished to Kaarport in 1859. He was recalled in the following year, and in September, 1861, was sent to pacify Bosnia and Herzegovina, which were again in

insurrection. This being accomplished, he attacked the Montenegrins, captured their chief town of Cetinji, and overran the country in 1862. Omar held the grand cross of the legion of honor, and was a knight of the Russian order of St. Anne. He ceased to take part in public life in 1869, being thereafter regarded as a minister without portfolio; and died in 1871.

OMBAY', or MALOEWA (Maluwa), an island between Celebes and the n.w. coast of Australia, lies to the n. of Timor, from which it is separated by the strait of Ombay, lat. 8° 8′ to 8° 28′ s., long. 124° 17′ to 125° 7′ east. Area, 961 sq.miles. The pop. amounts to about 193,800. The hills of Ombay are volcanic, and the coasts steep and difficult to approach. The inhabitants are dark brown, have thick lips, flat nose, and woolly hair; appearing to be of mixed negro and Malay origin. They are armed with the bow, spear, and creese, and live on the produce of the chase, with fish, cocoa-nuts, rice, and honey. A portion of the island formerly belonged to the Portuguese, but since Aug. 6, 1851, it is entirely a Netherlands possession. The Dutch post-holder resides at the village of Alor, to which iron wares, cotton goods, etc., are brought from Timor, and exchanged for wax, edible nests, provisions, and other native products. Ombay has oxen, swine, goats, etc., and produces maize, cotton, and pepper. Amber is also found, and the Boeginese of Celebes import European and Indian fabrics, exchanging them for the produce of the island, which they carry to Singapore.

O'MEARA, BARRY EDWARD, was b. in Ireland in the year 1786. Otherwise without claim to be remembered, his name remains notable from his connection with the first Napoleon, whom he accompanied to St. Helena as household physician. At the age of 18 he entered the British army as assistant-surgeon. In 1808, being stationed at Messina, he became concerned in a duel as second, under circumstances which must more or less have been held discreditable, as his dismissal from the service by sentence of court-martial was the result. Afterward he succeeded in procuring an appointment as surgeon in the navy, and as such for some years is certified to have discharged his duties with zeal and efficiency. As it chanced, he was serving with capt. Maitland in the Bellerophon, when the emperor Napoleon (q.v.) surrendered himself to that officer. During the voyage from Rochefort to Plymouth he was introduced to Napoleon, on whom the impression he produced was favorable, leading to a proposal that he should accompany the emperor into exile as private physician, an arrangement to which he acceded, stipulating that he should retain his rank in the navy, and be permitted to return to it at pleasure. By Napoleon, with whom he remained in daily intercourse at St. Helena for about three years, he seems to have been admitted to something more or less like intimacy; and occasionally it might well be, as he says, that the great captive would kill the creeping hours by loose talk with his attendant over the events of his strange life. Of these conversations O'Meara naturally enough took notes, which he afterward published. Meantime he became involved in the interest of Napoleon, in the series of miserable and petty squabbles which he waged with the governor, sir Hudson Lowe (q.v.). The result of these, as regards O'Meara, was that in 1818, after a violent altercation with sir Hudson, he was committed to close arrest, and was authorized by the emperor to resign his post. On his return to England, he addressed a letter to the admiralty, in which, among other things, he accused sir Hudson Lowe of intentions against the life of his captive, and even of having, by dark hints to himself, insinuated a desire for his services as secret assassin. For this he was instantly dismissed the service. The accusation was plainly monstrous and incredible. In 1822, after Napoleon's death, O'Meara published *Napoleon in Exile*, by which book alone he is now remembered. As conveying to the world the first authentic details of the prison-life of the great diseased, it made on its appearance an immense sensation, and— though for obvious reasons everywhere to be accepted, if at all, with caution—it is still not utterly without interest. The last years of O'Meara's life were passed in obscurity in the neighborhood of London, where, in 1836, he died.

OMELET, or OMELETTE, French, a dish chiefly composed of eggs. These are broken, and their contents put into a proper vessel, in which they are whipped into a froth, which is poured into a very clean and dry frying-pan, with the addition of lard or butter to prevent sticking, and then fried carefully, so that the outside is nicely browned. Before frying, one of a number of ingredients may be added to vary the omelet, such as chopped savory herbs, minced ham or bacon, salt-fish, shell-fish, game, etc. Or sweet omelets may be made by placing preserved fruits upon them when quite or nearly cooked. The omelet is an excellent dish, and, simple though it be, it requires much skill to prepare it successfully.

O'MEN (for the deriv., see OM), or PRODIGY (generally said to be from *pro* and *dico*, but more probably from *pro* and *ago*, to lead; hence anything conspicuous, or *extra*ordinary), the name given by the Romans to signs by which approaching good or bad fortune was supposed to be indicated. The terms *omen* and *prodigy* were not, however, exactly synonymous; the former being applied rather to signs received by the ear, and particularly to spoken words; the latter to phenomena and occurrences, such as monstrous births, the appearance of snakes, locusts, etc., the striking of the foot against a stone or the like, the breaking of a shoe-tie, and even sneezing, etc. If an omen or prodigy was promised on the part of a god, it was to be interpreted according to the promise; but otherwise, the interpretation was extremely arbitrary. It was supposed

that evil indicated as approaching might be averted by various means, as by sacrifices, or by the utterance of certain magic formulas; or by an extempore felicity of interpretation, as when Cæsar, having fallen to the ground on landing in Africa, exclaimed: "I take possession of thee, Africa." Occasionally, it is true, we read of a reckless disregard of omens; as, for example, when P. Claudius, in the first Punic war, caused the sacred chickens, who would not leave their cage, to be pitched into the sea, saying: "If they won't eat, they must drink." Still the belief in them was universal, and in general the greatest care was taken to avoid unfavorable omens. The heads of the sacrificial priests were covered, so that nothing distracting might catch their eyes; silence was enjoined at the commencement of every sacred undertaking, and at the opening of the *Ludi*. Before every sacrificial procession ran the heralds, calling on the people to "pay respect to it," and admonishing them to cease working till it should have passed, that the priests might not hear unfavorable sounds. At the beginning of a sacrifice the bystanders were addressed in the words *favete linguis* ("speak no word of evil import"), and the aid of music was sought to drown whatever noises might prove unpropitious. Compare AUGURIES AND AUSPICES, and DIVINATION. See also Fallati, *Ueber Begriff und Wesen des Rom. Omen* (Tüb. 1836).

The belief in omens has existed in all ages and countries, and traces of it linger even yet in the most civilized communities; in the dread, for instance, that many entertain at sitting down to table in a party of thirteen. Not a little of the philosophy of omens is contained in the Scottish proverb: "Them who follow freits, freits follow;" meaning, that a fatalistic belief in impending evil paralyzes the endeavor that might prevent it.

OMENTUM. See PERITONEUM.

OMISH, or AMISH, a branch of the Mennonites, founded in 1693, in Alsace, by Jacob Amman, from whom they derive their name. His special tenets were plainness in dress, absolute separation from the excommunicated, and washing of feet. His followers did not use buttons on their clothing, and were hence called *Häftler*, or "Hooker" Mennonites, while the rest of that body was called *Knöpfler*, or "Buttonites." Their number in this country is next to that of the old Mennonites.

OM MAN'I PADME HUM' is the "formula of six syllables" which has acquired much celebrity from the conspicuous part which it plays in the religion of the Buddhists, and especially in that form of it called *Lamaism* (q.v.). It is the first subject which the Thibetans and Mongols teach their children, and it is the last prayer which is muttered by the dying man; the traveler repeats this formula on his journey, the shepherd when attending his flock, the housewife when performing her domestic duties, the monk when absorbed in religious meditation, etc. It is met with everywhere; on flags, rocks, trees, walls, columns, stone-monuments, domestic implements, skulls, skeletons, etc. It is looked upon as the essence of all religion and wisdom, and the means of attaining eternal bliss. "These six syllables," it is said, "concentrate in themselves the favor of all the Buddhas, and they are the root of the whole doctrine . . . . ; they lead the believer to re-birth as a higher being, and are the door which bars from him inferior births; they are the torch which illuminates darkness, the conqueror of the five evils;" etc. They are likewise the *symbol* of transmigration; each syllable successively corresponding with, and releasing from, one of the six worlds in which men are reborn; or they are the mystical designation of the six transcendental virtues, each successive syllable implying self-offering (*dâna*), endurance (*kshânti*), chastity (*sîla*), contemplation (*dhyâna*), mental energy (*vîrya*), and religious wisdom (*prajnâ*). The reputed author of this formula is the Dhyâna-Bodhisattwa, or deified saint, *Avalokiteswara*, or, as the Thibetans call him, *Padmapâni* (i.e. the lotus-handed). It would not belong, accordingly, to the earliest stage of Buddhism, nor is it found in the oldest Buddhistic works of the north of India or of Ceylon. Its original sense is rather obscure. Some suppose that it means O! (*ôm*), the jewel (*mani*) in the lotus (*padme*), amen (*hûm*); "the jewel" being an allusion to the saint Avalokiteswara himself, and the word "*padme*, or in the lotus," to the belief that he was born from a lotus. It is probably, however, more correct to interpret the formula thus: "Salvation (*om*) [is] in the jewel-lotus (*mani-padme*), amen (*hûm*);" when the compound word "jewel-lotus" would mean the saint and the flower whence he arose. If this interpretation be correct, the formula would be originally nothing more than a salutation addressed to Avalokiteswara or Padmapâni; and the mystical interpretation put upon each syllable of it, would then be analogous to that which imparted a transcendental sense to each of the letters of the syllable Om (q.v.). Dr. Emil Schlagintweit, in his valuable work on *Buddhism in Thibet* (Leipsic, 1863), relates (p. 120) that "in a prayer-cylinder which he had the opportunity of opening, he found the formula printed in six lines, and repeated innumerable times upon a leaf 49 feet long and 4 inches broad. When baron Schilling de Canstadt paid a visit to the temple Subulin, in Siberia, the lamas were just occupied with preparing 100,000,000 of copies of this prayer to be put into a prayer-cylinder; his offer to have the necessary number executed at St. Petersburg was most readily accepted, and he was presented, in return for the 150,000,000 of copies he forwarded to them, with an edition of the Kanjur, the sheets of which amount to about 40,000. When adorning the head of religious books, or when engraved upon the slabs resting on the prayer-walls, the letters of the formula are often so combined as to form an anagram. The longitudinal lines occurring

in the letters "*manî padme hûm*" are traced close to each other, and to the outer longitudinal line at the left are appended the curved lines. The letter "*om*" is replaced by a symbolical sign above the anagram, showing a half-moon surmounted by a disk indicating the sun, from which issues a flame. Such a combination of the letters is called in Thibetan *nam chu vangdan*, "the ten entirely powerful (viz., characters, six of which are consonants, and four vowels);" and the power of this sacred sentence is supposed to be increased by its being written in this form. These kind of anagrams are always bordered by a pointed frame indicating the leaf of a fig-tree."—See also E. Burnouf, *Introduction à l'Histoire du Buddhisme Indien* (Paris, 1844); C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857–59); and the works quoted by these authors.

OMMI'ADES (Omaiades, or Ommeyades), a dynasty (deriving its name from an ancestor, Ommeyah) which succeeded to the Arabian caliphate on the death of Ali, the fourth caliph after Mohammed, and possessed it till superseded by the Abbasides (q.v.) in 750. Moawiyah, the founder of the dynasty, was the son of Abu-Sofiau, who defeated Mohammed at Beder, and his mother was the notorious Hinda. After the death of Othman the third caliph, Moawiyah, who was his cousin, claimed the throne, and during the whole of Ali's reign ruled over the western provinces of Syria and Egypt; but it was not till the death of that caliph, and the abdication of his son Hassan in 661, that MOAWIYAH'S authority was fully recognized. In that year he transferred the seat of the caliphate to Damascus; Kufa having been the residence of Ali, and Medina of the first three caliphs. The Arabs continued to extend their conquests during his reign; the Turks in Khorassan were subdued, Turkestan invaded, and several important aequisitions made in Asia Minor. But besides aggrandizing his empire, the caliph neglected no means of consolidating it, and partly for this reason he made the succession hereditary, and caused his son YEZID (680–83) to be recognized as his heir. The reigns of Yezid and his suecessors, MOAWIYAH II. (683) and MERWÂN I., formerly the traitorous secretary of the caliph Othman (683–85), are devoid of importance, as their sway extended only over Syria and Palestine. ABDULMELEK (685–705), an able and warlike prince, after a long and varying struggle of eight years, succeeded in rendering himself undisputed ruler of the Mohammedan world (692), but the latter part of his reign was much disturbed by rebellions in the eastern provinces. He was the first caliph who interested himself in the promotion of liberal knowledge, by causing the most celebrated poetical and other works of the Persians to be translated into Arabic; and under his reign coined money was first introduced. It was to this prince that his court-fool related the celebrated fabulous conversation between the owl of Bassora and that of Mosul. Four of his sons, WALID I. (705–16), SULIMAN (716–17), YEZID II. (720–23), and HESHÂM (723–42), successively occupied the throne, and a fifth son, Mosslemah, was, from his great military abilities and zealous devotion to the interests of his brothers, the terror of all their enemies, both domestic and foreign. Under Walid, the Ommiade caliphate reached the summit of its power and grandeur; northern Africa (709), and Spain (712), Turkestan (707), and Galatia (710) were conquered; while toward the close of his reign, his empire was extended even to the Indus. The slender structure of the minaret was now for the first time introduced into mosque architecture. OMAR II. (717–20), who, in the justice and mildness of his government, surpassed the whole of the race of Ommeyah, was appointed to suceeed Suliman; but having excited discontent among his relatives, by suppressing the formula of malediction, which had hitherto been regularly pronounced at all public ceremonies against Ali and his descendants, he was poisoned. During his reign, Mosslemah had completed the conquest of Asia Minor, and even compelled the emperor Leo to submit to the humiliation of walking beside his horse through the principal streets of Constantinople itself, and paying a large ransom (equivalent to about £140,000) for his capital. Heshâm, though like his immediate predecessor, fond of pleasure, possessed all the qualities necessary for a sovereign. The Greeks, who still strove for the possession of Asia Minor, were repeatedly defeated: the fierce Turks of northern Persia and Turkestan, were kept in stern subjection; and the civil affairs of the empire carefully and strictly administered. The death of Mosslemah, the champion of the Ommiade dynasty, seems to have been the signal for insurrection; the descendants of Ali raised the standard of revolt, and no sooner were they subdued than Ibrahim, the fourth in direct descent from Abbas the uncle of Mohammed, solemnly invested the celebrated Abu-Mosslem (stated to be a descendant of Koderz, one of the most distinguished heroes of Firdusi's admired work the *Shah-nameh*) with the arduous duty of enforcing his long-agitated claims to the throne. During this reign the progress of Arab conquest in western Europe was checked by Charles Martel, who inflicted upon the Arabs a severe defeat at Tours (732), and almost annihilated their army at Narbonne (736). The reigns of WALID II. (742–43), YEZID III. (743–44), and IBRAHIM (744), though of ephemeral duration, were long enough to produce a complete disorganization of the empire; and though MERWÂN II. (744–50), the next and last caliph of the house of Ommeyah, was both an able and politic ruler, and a skillful warrior, the declining fortune of his family was beyond remedy. Abu-Mosslem, who had published the claims of the Abbasides amidst the ruins of Meru in 747, took the field at the head of a small but zealous band, and carried the black flag of the Abbasides from victory to victory, till before the close of the following year the whole of Khorassan acknowledged his authority. Irak was subdued in 749; and though Ibrahim

the Abbaside claimant was seized by Merwân, and executed in the same year, his brother Abul-Abbas succeeded to his claims, and the unfortunate caliph, defeated in two engagements, fled to Egypt (750), whither he was pursued and slain. Abdallah, the uncle of the successful claimant, treacherously invited the remaining members of the house of Ommeyah to a conference, and ordered a general massacer of them. Two only escaped: the one to the s.e. of Arabia, where he was recognized as caliph, and his descendants reigned till the 16th c.; the other, Abderrahman, to Spain, where he founded the caliphate of Cordova.

Ommiades of Spain.—Abderrahman I. (755–787), on accepting the Spanish throne, which was offered him by the Arab chiefs, assumed the title of *Caliph* and *Emir-al-mumenin*, and in spite of numerous revolts, strengthened and extended his power in Spain, till, with the exception of Asturias and the country n. of the Ebro, his authority was everywhere acknowledged. His defeat of Charlemagne at Roncesvalles (q.v.) is too widely known to require further notice. He divided his kingdom into six provinces, whose rulers, with the *walis* of the twelve principal towns, formed a sort of national diet. His successors, Hesham I. (787–96) and Al-Hakem I. (796–821), were much troubled with internal revolts, under cover of which the Christians in the n.e. established the state known as the "Spanish March." Abderrahman II. (821–52) re-established internal quiet, and occupied his subjects with incessant wars against the Christians. These conflicts developed among the Arabs that chivalrous heroism which is found nowhere else in the Mohammedan world. Abderrahman, himself a man of learning, greatly encouraged the arts and sciences, and diffused information among his people; he also attempted, by regulating the laws of succession to property, to constitute his kingdom on a basis analogous to that of other European nations. During his reign Mohammedan Spain was the best governed country in Europe. His successors, Mohammed I. (852–80), Mondhar (880–82), and Abdallah (882–912), followed in his footsteps. Abderrahman III. (912–61), after suppressing some dangerous revolts which had gathered head during his minority, conquered the kingdom of Fez from the Edrisites, and brought a long and exhausting war with the powers of Asturias and Leon to a victorious conclusion. This period is justly termed the golden age of the Arab domination in Spain, for at no period was their power so consolidated, and their prosperity so flourishing. Abderrahman, like his predecessors, was a great encourager of learning, and a poet of no mean ability. He founded schools which far surpassed those in other parts of Europe. His son, Al-hakem II. (961–76), was in every way worthy to be his successor, but his premature death was the cause of the downfall of the Ommiades in Spain. Hesham II. (976–about 1013), a child of eight years, now occupied the throne; but fortunately his mother, Sobeiha, possessed the abilities necessary for such an emergency, and appointed as her son's vizier Mohammed ben Abdallah, surnamed Al-Mansor, who had originally been a peasant. This remarkable man gained the affections of all ranks by his pleasing manners and great abilities; his administration was equally just and judicious, and his encouragement of literature, science, and art alike liberal and discriminating. But it is as a warrior that he is chiefly remembered; he had vowed eternal enmity to the Christians, and in all his numerous expeditions fortune seemed chained to his standard. The lost provinces were recovered; Castile, Leon, and Barcelona were conquered; and Navarre was on the point of sharing the same fate, when a rebellion in Fez compelled him to detach a portion of his force for service in Africa, and the combined armies of the four Christian monarchies, seizing this opportunity, inflicted upon the Arabs a sanguinary defeat in 1001. Mohammed's spirit was completely broken by this blow, and he died a few days afterwards. With him the star of the house of Ommeyah set for ever. The rest of Hesham's reign was a scene of disorder and civil war. Pretenders to the caliphate arose, while the "walis" of the various provinces set up as independent rulers, and the invasions of the Christians added to the confusion. Hesham finally resigned the throne about 1013; and, with the exception of the brief reign of Hesham III. (1027–31), from this time the family of Ommeyah, which had for more than two centuries so happily and brilliantly governed the greater part of Spain, disappears from history. One remarkable feature of their rule deserves mention, as it contrasts them so favorably with the contemporary and subsequent rulers of Spain, even to the present time, and that is their universal toleration in religious matters.

OMNIBUS (Lat. *omnibus*, "for all,"), familiarly contracted into "bus," is the largest kind of public street conveyance, and is appointed to travel between two fixed stations, starting at certain fixed hours, and taking up or setting down passengers at any point on its route. Vehicles of this sort were first started in Paris in 1662, when it was decreed, by a royal edict of Louis XIV., that a line of *carosses à cinq sous* ("twopence-halfpenny omnibuses"), each containing eight places, should be established for the benefit of the infirm, or those who, requiring speedy conveyance from one part of the town to another, were unable to afford a hired carriage for themselves; these "carosses" were bound to run at fixed hours from one station to another, whether full or empty. The public inauguration of the new conveyances took place March 18, 1662, and was the occasion for a grand fête; and the novelty took so well with the Parisians, that the omnibuses were for some time monopolized by the wealthier classes. However, when the rage for them died away, it was found that those for whose special benefit they were instituted

made no use of them, and they, in consequence, gradually disappeared. The omnibus was not revived in Paris till 1827, when it was started in its present form, carrying from 15 to 18 passengers inside, with only the driver above and the conductor behind; and on July 4, 1829, they were introduced into London by a Mr. Shillibeer. Shillibeer's conveyances, which for some time afterwards were known as *shillibeers* (an epithet still in common use in New York), were of larger size than the French ones, carrying 22 passengers inside, and were drawn by three horses abreast. The omnibus was introduced into Amsterdam in 1839, and since that time its use has been extended to all large cities and towns in the civilized world. The seats of the omnibus are generally placed lengthwise, and the door behind. The omnibus is managed by a driver and a conductor. In New York, omnibuses are drawn on street-railways; and this practice is now being extensively employed in the chief towns of Great Britain, where the omnibuses are called tramway cars, and the railway a tramway.

OMNIUM, a term used at the stock exchange to express the aggregate value of the different stocks in which a loan is funded. See M'Culloch's *Dictionary of Commerce.*

OMSK, a t. of the Russian province of Central Asia, in the government of Akmollinsk, stands at the confluence of the Om—a river upwards of 200 m. in length—with the Irtish; 2,225 m. from St. Petersburg. Lat. 54° 59′ n., long. 73° 30′ east. It was built in 1716, as a defense against the Khirghiz; but is now of no importance as a fortress. It was till a recent date the center of government for Western Siberia, the center of the administration of the Siberian Khirghiz, the seat of the courts of justice, and of the Siberian corps of cadets. It contains manufactories and mining works. Hitherto its commerce has been limited to a trade with the Khirghiz, who drive up their cattle to this place; but its advantageous position on the great post-road and commercial line of traffic from Europe across the whole of Siberia to the Chinese frontier, makes it probable that it will some day become an intermediate station for extensive commercial exchanges. Pop. '80, 30,890.

OMUL, *Salmo migratorius*, a fish of the salmon and trout tribe, abounding in lake Baikal and other waters of the e. of Siberia, from which great quantities are sent salted to all the western parts of that country. In size it is rarely more than 15 or 16 in. long. Its flesh is very white and tender. It ascends rivers in shoals for the purpose of spawning.

ON. See Heliopolis, *ante.*

O'NAGER. See Ass.

ONAGER. See Balista.

ONAGRA'CEÆ, Onagrariæ, or Œnothera'ceæ, a natural order of exogenous plants, consisting chiefly of herbaceous plants, but including also a few shrubs; with simple leaves, axillary or terminal flowers; the calyx superior, tubular, sometimes colored, its limb usually 4-lobed; the petals inserted into the throat of the calyx, generally equal in number to its segments; the stamens generally 4 or 8, rarely 1 or 2, inserted along with the petals; the ovary generally 4-celled, sometimes 2-celled; the style thread-like, the fruit a capsule or a berry. There are about 450 known species, natives chiefly of temperate climates, among which are some much cultivated for the beauty of their flowers, particularly those of the genera *fuchsia, œnothera* (evening primrose), *clarkia,* and *godetia.* The British genera are *epilobium* (willow-herb) and *circæa* (enchanter's nightshade). A few species produce edible berries, and the roots of 1 or 2 are eatable; but none are of economical importance. The root of *isnarda alternifolia,* found in the marshes of Carolina, and called *Bowman's root,* is emetic. Some species of *jussiæa* are used in dyeing in Brazil.

ONAGRACEÆ (*ante*), a natural order of exogenous herbs constituting the evening primrose family, principally found in America, but also inhabiting temperate latitudes in the eastern continent. There are several genera, the principal of which are *circæa, epilobium œnothera,* and *Ludwigia.* Circæa, or enchanter's nightshade, named from Circe the enchantress, is a low perennial, growing in cool or damp woods; calyx tube slightly prolonged, deciduous; lobes 2, reflexed; petals 2, inversely heart-shaped; stamens 2; pod does not split open. Two species from Europe, *C. lutetiana,* and *C. alpina. Epilobium* or willow herb, has several species in this country, most of them brought from Europe. The great willow herb, *E. nugustifolium,* has a simple, tall stem from 4 to 7 ft. high, with lanceolate leaves, and grows on low grounds, in newly cleared lands; flowers pink-purple, very showy. *E. alpinum* is found on the summits of the White mountains, and also the Adirondacks. It is only from 2 to 6 in. high, nearly smooth; stem simple; leaves ovate-oblong, obtuse, on short leaf stalks; flowers few or solitary, drooping in the bud; petals purple; pods long, smooth. *E. molle* (Torrey), native in bogs from Rhode Island to Pennsylvania and Michigan northward. It grows from one to one foot and a half high; soft-downy all over; erect, branching toward the top; leaves crowded; linear-oblong or lanceolate; petals rose color, small. Œnothera, or the evening primrose, is the principal genus. *Œ. biennis,* or the common evening primrose, has ovate-lanceolate leaves, acute, obscurely notched; flowers in a terminal spike; calyx much prolonged; petals inversely cordate, light yellow color; pods oblong; several varieties, as *muricata, grandiflora, parviflora, cruciata,* and *oakesiana.* The other species of

œnothera are *rhombipetela* (having rhombic petals), *sinuata*, *glauca*, *fructiosa* (sundrops), *riparia*, *linearis*, *chrysantha*, *serrulata*, and *pumila*. This latter grows southward along the Alleghanies, flowering in June. The *Œ. serrulata* is found at the falls of St. Anthony, and in Wisconsin and westward. In the genus *Ludwigia*, or false loosestripe, the calyx tube is not at all prolonged beyond the ovary; petals 4, small or wanting; stamens 4; pod short, many seeded; seeds minute and naked. Named in honor of Christian G. Ludwig, professor of botany at Leipsic, contemporary with Linnæus. The seed-box and water purslane are species belonging to this genus, the former growing in swamps along the coast, the latter in swamps or ditches, and very common.

ONCIDIADÆ, a family of gasteropod mollusks, belonging to the section *pulmonifera*, division *inoperculata*. The animal is slug-like and without a shell. The body resembles that of the garden slug, but has a shield-like leathery covering to the back; head continuous with the body, and the eyes at the end of non-retractile cylindrical pedicels which spring from near the antero-lateral margins. There are no tentacles, and the lingual ribbon is broad, with nearly uniform teeth in numerous, straight, transverse rows. There are several genera, the species living in damp places near either fresh or salt water, and they are supposed to live on vegetable food. They are tropical, or inhabit warm climates, with the exception of one species, *peronia celtica*, which is British.

ONCKEN, Johann Gerhard, b. at Varel, Oldenburg, Germany, about the year 1800. In early life he was a domestic servant; afterward lived in England, where he married. At Hamburg he joined an English Independent church, opened a book-store, and acted as agent of the Lower Saxony tract society and the Edinburgh Bible society. In 1834 he organized a Baptist church with 6 others, and became its pastor. In 1835 the American Baptist general convention appointed him their missionary. As such he visited nearly all Germany and Denmark. He was imprisoned several times in Hamburg for preaching and baptizing, but the kindness shown by his family and congregation to those who had suffered by the great fire in 1842 led the senate to grant them unconditional liberty of worship. Since that time Oncken has zealously performed his mission work, preaching, baptizing, distributing the Scriptures, writing, and publishing religious books and tracts, establishing churches in Denmark, Switzerland, Austria, and some of the states of Germany, editing, with the aid of his daughter, a religious periodical in English, and another in German. In 1853 he visited the United States to obtain funds for the erection of chapels. The number of churches which he established in 30 years was 76, with 11,289 church members. Connected with these churches are 95 Sunday-schools, 240 teachers, and 2,662 scholars,

ONCOCARPUS, a genus of trees of the natural order *anacardiaceæ*. One of the most remarkable trees of the Fiji islands is *O. atra*, or *O. vitiensis*, a tree about 60 ft. high, with large oblong leaves and a corky fruit, somewhat resembling the seed of a walnut; the sap of which, if it comes into contact with the skin, produces a pain like that caused by red-hot iron. The wood is often called itch-wood, because of the effect produced on persons who ignorantly or incautiously bark it whilst the sap is fresh, even the exhalations causing an intolerable itching and innumerable pustules, with excessive irritation for several days, whilst the effects continue to be unpleasantly felt even for months.

ON'DERDONK, Benjamin Tredwell, d.d., ll.d., 1791–1861; b. New York; graduated at Columbia college 1809; ordained a presbyter in the Protestant Episcopal church 1813; was a professor in the General theological seminary 1826–35; bishop of the diocese of New York 1830–45, when, having been tried by the house of bishops on charges preferred against him, he was suspended from the exercise of his official functions.

ONDERDONK, Henry Ustick, ll.d., 1789–1858; b. New York; graduated at Columbia college 1805; studied medicine in London, and took the degree of m.d. at Edinburgh 1810; studied theology and was ordained deacon in the Protestant Episcopal church 1815; settled at Canandaigua, N. Y., 1816–20; rector of St. Ann's church, Brooklyn, N. Y., 1820–27; assistant bishop, and, on the death of bishop White, bishop of the diocese of Pennsylvania 1827–44, when, having been tried by the house of bishops, on charges preferred against him, was suspended; was restored 1856, but did not resume the active exercise of his office.

O'NEALL, John Belton, ll.d., 1793–1863; b. S. C., a graduate of the university of South Carolina at Columbia, class of 1812, and was a teacher in the Newberry academy. He studied law, but left his reading to carry a musket in the war with England that occurred in that year, returning in due time to the more limited field of litigation, was admitted to the bar in 1814, inaugurating a successful practice. He represented his district in the legislature of his native state in four sessions, 1816, '22, '24, and '26; was elected speaker in '24 and again in '26. He rose rapidly to distinction as a jurist. In 1828 he was appointed associate judge; in 1830 judge of the court of appeals; in 1850 presiding judge of the court of errors and the court of law appeals, and filled the office of chief justice of the supreme court of South Carolina. In 1832 he gave up the use of stimulants, and in 1841 was elected president of the state temperance society. He was an active philanthropist, and in 1852 was elected to fill the highest office in the order of sons of temperance of North America. He wrote *A Digest of the Negro Law of South Carolina*, *Annals of Newberry, S. C.*, and *Biographical Sketches of the Bench and Bar of*

South Carolina, and contributed reminiscences of the revolution to the *Southern Literary Messenger*.

ONE'GA, a small t. and sea-port in the n. of Russia, in the government of Archangel, and 90 m. s.w. of the city of that name. It stands at the mouth of a river, and on the shore of a gulf of the same name; the latter a branch of the White sea. Lat. 63° 54′ n., long. 38° 7′ east. Pop. '77, 2,309, employed in connection with the saw-mills of the "Onega Trading Wood Company." In these mills, where numerous men are at work, an English steam-engine has been erected. About 50 ships leave the port annually for England, with cargoes of deals and timber to the value of £37,000.

ONEGA, LAKE, an extensive lake in the n. of Russia, government of Olonetz, and, after Ladoga, the largest lake in Europe; is 59 m. in greatest breadth, and about 150 m. in length. Area, 3,720 sq. miles. It is fed by numerous rivers, and receives through the river Wodlo the waters of the lake of that name. Its only outlet is the river Swir, which flows s.w. into lake Ladoga. By means of the Mariinsky system of communication, lake Onega communicates with the Volga, and thence with the Caspian sea on the s., and with the Dwina, and thence with the White sea on the north. The clear and beautiful waters of this lake are rich in fish, and embrace many islands. The depth ranges from 550 to 700 ft. The navigation of the lake is dangerous, and commerce is chiefly confined to the Onega canal, which extends from the town of Vytegra on the river of that name to the river Swir.

ONE'GLIA, a t. of n. Italy, in the province of Porto Maurizio, on the gulf of Genoa, 40 m. e.n.e. from Nice, at the mouth of the Impero, a small river which rushes down from the Apennines. The harbor is not good. The principal article of export is oil. Andrea Doria, the great Genoese admiral was born here. Pop. about 8,000.

ONEI'DA, a co. in s.e. Idaho, having Montana on the n., Wyoming on the e., Utah on the s., and the Snake river and its tributaries on the n. and w.; 17,850 sq.m.; pop. '80, 6,965—5,023 of American birth, 72 colored. It is drained by the Snake river, Port Neuf, Blackfoot, and John Gray's, the Port Neuf irrigating a large section of arable land set off for an Indian reservation. Bear lake valley in the s.e. contains a Mormon settlement, whose inhabitants are engaged principally in farming. Gold is found, and there are salt, medicinal, and hot springs. In the n.e. portion the land rises into three high mountains, one of them, mount Hayden, 13,858 ft. above the level of the sea. A large proportion of the county is covered with pine forests, the elevated portions affording excellent pasturage. The soil of the river bottoms is very fertile, but for the most part uncultivated. Co. seat, Malad City.

ONEI'DA, a co. in central New York, having Oneida lake and Oneida creek for a portion of its w. boundary, and West Canada creek on the e.; drained by the Mohawk, Black, Oriskany, and Fish rivers; 1215 sq.m.; pop. '80, 115,475—92,038 of American birth, 622 colored. It contains the head-waters of the Chenango and Unadilla rivers, and Trenton falls of West Canada creek, having 5 cascades and a total descent of 400 ft. in a course of 2 miles. Near the falls are quarries of Trenton limestone; other mineral products are iron ore, gypsum, peat, and marl. Its soil is exceptionally fertile, especially in the Mohawk valley extending across the county from e. to w., and spreading out into broad green fields diversified by pasture lands of superior elevations, celebrated for its wild and rough, but charming scenery. N. and s. of this valley the surface is hilly. It is intersected by the Erie and Chenango canal, the Black River canal, and Oneida Lake canal, also by the New York Central and Hudson River railroad, the Utica and Black River, the Rome, Watertown and Ogdensburg, and the Utica, Chenango and Susquehanna Valley railroads. Its agricultural products are grain, live stock in great numbers, dairy products, maple sugar, hops, and potatoes. The leading industries are the manufacture of furniture, wooden-ware, lime, cement, cotton and woolen goods, metallic wares, boots, and shoes, hosiery, iron castings, etc. It has distilleries, breweries, flour, saw, and lumber mills. Co seat, Utica.

ONEI'DA, a village in Lenox township, Madison co., N. Y., at the junction of the New York and Oswego Midland, and the New York Central and Hudson River railroads; pop. '80, 3,934. There are 3 weekly newspapers, 2 banks, and an academy. The village is the center of a flourishing country trade.

ONEI'DA COMMUNITY (PERFECTIONISTS, *ante*), after continuing 30 years unmolested in the practice of what they called "complex marriage," every man being considered as married to every woman and every woman to every man, found themselves surrounded with a state of public opinion that led to a resolute effort to break up this offensive feature of their association. In 1879 a conference of clergymen of different denominations and from the principal cities in the state of New York, was held at Syracuse to form a plan for eradicating the evil. A committee then appointed proceeded to collect evidence bearing on the actual practices of the community. Before their report was published the effect of the agitation of the subject was manifested in a proposition made by the leader of the community to its managers to abandon the distinctive feature of their association; not because they were convinced of its immorality, but in deference to the public sentiment that was evidently rising against it. This proposition having been accepted by the managers, an announcement was afterward publicly made

that the Oneida community had abandoned what they had called "complex marriage," and would hereafter be divided into the regularly married and those who prefer to remain single. And this was followed in due course by articles of association being filed, according to law under the name of the Oneida community, "*limited*," which was to be the same as the old association of the same name, except that the marital relations of its members were changed.

ONEI'DA LAKE, in central N. Y., 18 m. long by 6 m. wide, and 12 m. n.e. of Syracuse, occupying portions of Oneida, Madison, Oswego, and Onondaga counties. It is 369 ft. above the level of the sea, abounds in fish of excellent quality, and empties into the Oneida river.

ONEI'DAS, a tribe of American Indians whose name signifies "tribe of the granite rock." Originally belonging to the Mohawks, they were set off from them and formed part of the Iroquois confederation of Six Nations. Their possessions included the section of country between Deep Spring near Syracuse, Onondaga co., N. Y., and a point directly e. in the vicinity of Utica, Oneida co., and embracing the lake which takes its name from them. Their *totem*, or symbol, was a stone in a forked stick. The tribe was divided into 3 clans, the wolf, bear, and turtle, and 9 sachemships. In the earliest years of the settlement of Canada they sustained hostile relations with the French, and the Hurons, and Montagnas, who were friendly to the Canadian settlers—only occasionally relaxing their enmity sufficiently to permit the visits of missionaries; and although their fellow members of the confederation, the Onondagas, made peace with the French in 1665, they kept up the war until 1666; the French making two raids into their country. At the time of the treaty they were reduced to 150 warriors, who joined in the general treaty of peace with the French, Sept. 8, 1700, being governed thereafter in their movements by the English, until the revolution, when they with the Tuscaroras were faithful to the colonists. This was owing to the influence of Samuel Kirkland, a Congregational minister, appointed missionary in 1766 by a missionary board in Connecticut who settled in the midst of the tribe and was with them when the war broke out. He left them at that time to fill a chaplaincy in the army, but was engaged in negotiations with them throughout the war, and accompanied some of their warriors in 1791 to the meeting of congress in Philadelphia. By their fidelity to the colonists they incurred the enmity of other tribes, who, led by Joseph Brant or Thayendanega, a famous chief of the Mohawks and leader of the Iroquois, drove them from their homes and burned their church and houses; in this aided and abetted by the British and their adherents. At the close of the war they with the Tuscaroras were the only members of their confederation who remained in the United States, the remainder settling on Grand river in Canada. By the treaty of fort Stanwix, Oct. 23, 1784, they were confirmed in their title to their lands, and in 1785 and 1788 the state of New York purchased their lands, with the exception of a reservation for each, which was never to be sold, and leased only in part. The Brotherton and Stockbridge Indians retained their lands which they had received from them and now live on the same reservation. In 1840, 430 emigrated to Canada. Those who settled at Green bay, Wisconsin, purchased the lands, and have erected churches, and availed themselves of educational privileges, advancing as fast as possible in agriculture and mechanical arts. There are 65,540 acres of land in this reservation, the inhabitants numbering 1,500 in '80. They are mostly Episcopalians, the book of Common Prayer having been translated into their language. There were in 1873, 633 on the Thames, in the province of Ontario, and 172 in New York in '80, near Oneida castle, s. of Utica, having 1 church. The number in the year indicated belonging to the tribe is larger than at any time since the advent of white population into their domain, and double their number at the close of the war. Several works have been written on this tribe and the Iroquois confederacy, beginning with Colden's *History of the Five Nations*, 1727, and leading up to works on the celebrated chieftains which were published as late as 1864 and 1866. In the war of 1812 the English and American parties in the Iroquois confederation were as sharply divided and took the same sides as in the revolution, but the Oneidas stood by the Americans always, and have since been at peace.

O'NEILL, Eliza (Lady Becher). See page 895.

ONEROUS CAUSE, in Scotch law, means a pecuniary or valuable consideration.

ONGARO. See Dall' Ongaro, Francesco, *ante*.

ONION (Fr. *oignon*, from Lat. *unio*, a pearl, but found in Columella, signifying a kind of onion), the name given to a few species of the genus *allium* (q.v.), and particularly to *A. cepa* (Lat. *cepa*), a biennial bulbous-rooted plant, with a swelling stem, leafy at the base, tapering fistular leaves, a reflexed spathe, a large globose umbel, usually not bulbiferous, the lobes of the perianth obtuse and hooded, not half as long as the stamens. The bulb is simple—not composed of cloves like that of garlic; and in the common variety is solitary, showing little tendency to produce lateral bulbs. The native country of the onion is not certainly known, some supposing it to be India and some Egypt, in both of which it has been cultivated from the most remote antiquity. The part chiefly used is the bulb, but the young leaves are also used and young seedlings drawn from onion beds are a very common ingredient in soups and sauces in the beginning of summer. These are known in Scotland as *syboes* (evidently another form of the word *cibol*). In warmer climates the onion produces a larger bulb

and generally of more delicate flavor than in Britain; and is more extensively used as an article of food, being with us whether fresh or pickled, generally rather a condiment. In Spain and Portugal a raw onion is often eaten like an apple, and often with a piece of bread forms the dinner of a working-man. The onion is, however, very nutritious. It contains a large quantity of nitrogenous matter and of uncrystalizable sugar; with an acrid volatile sulphurous oil, resembling oil of garlic. The oil of the onion is dissipated by boiling so that boiled onions are much milder than raw onions. In Britain onions are sown either in spring or in August. Great fields of them as of other favorite vegetables are cultivated for the London market; and large quantities of onions are also imported from more southern regions. The Bermudas are celebrated for their onions. The onion loves a rich light soil and a dry subsoil. The transplanting of onions is often practiced, especially of onions sown in autumn which are transplanted in spring, and when these are placed so that the small bulbs are on the surface of the ground, and surrounded with decayed manure, very large bulbs are obtained. The frequent stirring of the soil is of great advantage. The bulbs are taken up when the leaves decay, and after being dried in the open air or in a loft, may be kept for a considerable time.—The POTATO ONION, also called the EGYPTIAN or GROUND ONION, is a perennial variety which produces offset bulbs at the root like the shallot; but the bulbs are much larger than those of the shallot and have less of the flavor of garlic, although stronger than those of the common onion. It is sometimes said to have been introduced into Britain from Egypt by the British army in 1805, but erroneously, as it was cultivated in some parts of Britain long before. It is in very general cultivation among the peasantry in some parts of Scotland.—The PEARL ONION is a similar variety with much smaller bulbs.—The TREE ONION is also generally regarded as a variety of the common onion. It produces bulbs at the top of the stem, the umbels becoming viviparous.—Onions are similar to garlic (q.v.) in medicinal properties but milder. As a condiment or article of food they agree well with some stomachs and stimulate digestion, but are intolerable to others. Roasted onions with oil make a useful emollient and stimulating poultice for suppurating tumors. The use of onions stimulates the secreting organs.—The CIBOL or WELSH ONION (*A. fistulosum*), a native of Siberia, cultivated in Britain but more generally in Germany, has a perennial fibrous root with no bulb, very fistular leaves and a 3-cornered ovary. It is useful as supplying tender green leaves for culinary use in the beginning of spring, like the chive, and somewhat earlier in the season. It is much larger than the chive but its use is similar.

ONIS'CUS. See WOODLOUSE.

ON'KELOS, the supposed author of an Aramaic version (Targum) of the Pentateuch. The name seems a corruption from that of Akilas, one of the Greek translators of the Old Testament (see AQUILA). The translation said to be by Onkelos, is, in its present shape at least, probably the work of the Babylonian schools of the 3d and 4th centuries A.D. At first orally transmitted, various portions of it began to be collected and written down in the 2d c., and were finally redacted about the time mentioned. The history of the origin and growth of Aramaic versions in general will be treated under *Targum* (VERSIONS). The idiom of Onkelos closely resembles that of Ezra and Daniel. The translation itself is executed in accordance with a sober and clear, though not a slavish exegesis, and keeps closely to its text in most instanees. In some cases, however, where the meaning is not clear it expands into a brief explanation or paraphrase, uniting the latter sometimes with Haggadistic by-work, chosen with tact and taste, so as to please the people and not to offend the dignity of the subject. Not unfrequently it differs entirely from the original, as far e. g., as anthropomorphisms and anthropopathies—anything, in fact, which might seem derogatory to the Deity—are concerned. Further may be noticed a repugnance to bring the Divine Being into too close contact, as it were with man, by the interposition of a kind of spiritual barrier (the "word," "Sheehinah," "glory") when a conversation or the like is reported between God and man. Its use lies partly in a linguistic, partly in a theological direction; but little has been done for its study as yet. Notwithstanding the numerous MSS. of it extant in almost all the larger libraries of Europe, and in spite of the grossly incorrect state of our current printed editions, no critical edition has ever been attempted.

ONOBRY'CHIS. See SAINTFOIN.

ONOMAC'RITUS, a celebrated religious poet of ancient Greece, lived at Athens in the time of the Peisistratidæ. He collected and expounded—according to Herodotus—the prophecies or oracles of Musæus (q.v.), but is said to have been banished from the city by Hipparchus, about 516 B.C , on account of interpolating something of his own in these oracles. He then, we are told, followed the Peisistratidæ into Persia, and while there was employed by them in a very dishonorable way. They got him to repeat to Xerxes all the ancient sayings that seemed to favor his meditated invasion of Greece. Some critics, among whom is Aristotle, have inferred from a passage in Pausanias that Onomacritus is the author of most of the so-called Orphic hymns. More certain, however, is the view which represents him as the inventor of the great Orphic myth of Dionysud Zagreus, and the founder of Orphic religious societies and theology. Pausanias states that "Onomacritus established orgies in honor of Dionysus, and in his poems representes the Titans as the authors of the sufferings of Dionysus." See Müller's *Geschichte der*

Griech. Literatur bis auf das Zeitalter Alexander's (Breslau, 1841); Grote's *History of Greece*, etc.

ONOMATOPŒ'IA, the Latin form of the Greek word *onomatopoïïa*, means literally the making or invention of names, and is used in philology to denote the formation of words in imitation of natural sounds, as in *cuckoo*, Lat. *cucu* (lus); *pee-wit*, Scan. *pee-weip*, Dutch, *kiewit; cock; clash, rap, tap, quack, rumble, whizz, clang.* Such words are sometimes called onomatopœias; more properly they are onomatopœian, or formed by onomatopœia.

In a more extended sense, the term is applied to the rhetorical artifice by which writers (chiefly poets) seek, through the choice and arrangement of words, to make the "sound," throughout whole phrases and sentences, "an echo to the sense," as in Homer's well-known *poluphloisboio thalasses*, expressive of the breaking of the waves upon the sea-shore; or where Tennyson makes the sea

Roar rock-thwarted under bellowing caves.

The occurrence of so many obviously onomatopœian words in all known languages, suggests the question, whether the same principle may not have been concerned in producing the original germs or roots of the great bulk of words. There is little hope that the question will ever be conclusively settled either way; for the changes of time have made it, in most cases at least, impossible to say what the first form and signification of a root were; but the balance of arguments seems in favor of the affirmative answer. "The action of the mind," as it has been expressed, "produced language by a spontaneous repercussion of the impressions received." Now, the articulate sound first affixed in this way to an object or an action as its sign cannot be conceived as arbitrary; nor is there any mysterious and inherent correspondence between any one conception of the mind, and a particular articulate sound. The sound uttered must have been suggested by something connected with the object or action itself; and by what more naturally than by the inarticulate sound which the object or action itself emits?

The chief objection to this theory is, that if the first words were merely reproductions of natural sounds, the same natural objects would have had the same names all the world over. To which it is answered, that the mind in its first efforts at naming did not seek an exact reproduction of the sound, but a suggestive imitation; primitive words were not echoes, but "artistic representations." Now, the sounds of nature are not simple, but composite. Like other concrete phenomena, they present a variety of aspects; and according as one or another aspect seemed the most prominent to the observer, a different vocal sound would suggest itself as the appropriate symbol. Thus when professor Max Müller argues (*Science of Language*, Lond. 1861) that if the "bow-wow" theory, as he nicknames it, were true, men would have everywhere spoken of a *moo*, as is done in the nursery, and not of a *cow;* it seems a valid answer to say, that the Indian *gu*, the Teut. *kuh* (Eng. *cow*), and the Græco-Lat. *bou-*, are really as suggestive imitations of the animal's actual voice as *moo*. To take a more striking instance: few words differ more in sound and aspect than the Eng. *thunder* (Ger. *donner*, Lat. *tonitru*, Fr. *tonnère*) does from the Mexican name for the same thing, *tlatlatnitzel*, and yet it would be difficult to say which is the more suggestive of the natural sound.

It is no doubt true that the great bulk of names are derived from roots having a general predicative power; but this by no means excludes the principle of onomatopœia. Thus, to take one of the instances adduced by professor Müller himself, that of *raven* or *crow* (Sans. *kârava*, Lat. *corvus*, Gr. *korōnē*); this is derived from the root *ru* or *kru*, which means to cry or call, and the bird was called a kârava, or crow, not in imitation of his voice, but because he was "a shouter; a caller, a crier. The name might have been applied to many birds, but it became the traditional and recognized name of the crow." But how came the articulation *ru* or *kru* to be chosen to convey the general meaning of crying or calling; may we not suppose that it was suggested by the voice of birds of the crow kind, whose notes are most markedly cries or calls to their fellows, as distinguished from singing? Once adopted in this particular case, it would naturally be extended to any kind of cry or call, from the harshest to the softest.

ONONDA'GA, a co. in central New York, separated from lake Ontario by Oswego co., and bounded also on the n.e. by Oneida lake and river, and on the s.w. by Skaneateles lake; drained by Seneca river and Chittenango and Onondaga creeks; intersected by the Erie canal, the New York Central railroad, and minor lines centering at Syracuse (q.v.); pop. '80, 117,887—94,509 of American birth. The surface is level in the w. and undulating or hilly in the east. There is excellent farming land, producing all the cereals. The dairy products are large and noted for their excellence. Salt, gypsum, and limestone suitable for building purposes are found. Co. seat, Syracuse; there are about thirty other towns and villages.

ONONDA'GA LAKE, in Onondaga co., N. Y., near Syracuse, is 5 m. long, about a mile wide, and its greatest depth is 65 feet. Its waters are saltish and stagnant, and, as there are extensive salt formations in the vicinity, it is supposed that the lake was formed by the gradual dissolving of the salt rock and the consequent falling in of the ceiling of the cave thus formed. Seneca river is the outlet.

ONONDAGA, N. Y. See page 896.

ONONDA'GAS, one of the five tribes of Iroquois Indians which inhabited and gave their name to Onondaga county, N. Y.; these five tribes forming a confederacy, which

was ruled over successively by 14 great sachems, the *atotarho*, the Onondaga chief, being the first; they had charge of the wampum belts, the treaties, and the council fires, and their dialect was considered the purest and grandest of the confederacy. Their principal village was about 5 m. from Syracuse. It is not known in what year the confederacy was formed, but as early as 1609 they were waging war with their neighbors, the Hurons, against whom they were bitterly hostile; and in 1649 gathered their forces and devastated the settlement of the Hurons, many of whom were killed and some made prisoners, the whole tribe being scattered. Then followed an unsuccessful war with the Eries and Susquehannas. In 1653 a treaty of peace of short duration was effected with the French, who, at the solicitation of the Onondagas, sent missionaries among them, and established a settlement there, which was abandoned a year later on the settlers discovering a plot for their massacre by the Indians. The Onondagas were continually at war with the Algonquins of Canada, and in 1662 they devastated Montreal island and killed the renowned Indian fighter Lambert Closse. In 1668 the French again settled among them. Onondaga county became alternately the rendezvous for the French and English; the latter a few years later building a fort there, which was demolished by the Indians before their withdrawal from the town during Frontenac's incursion in 1696. A general treaty of peace was signed in 1700, between the French and the Onondagas at Montreal, which lasted 9 years. They took sides with the English in the French and Indian war, 1756–63, and also during the latter part of the revolutionary war, in which they suffered severely. They ceded the most of their land to New York in 1798, reserving a small portion for themselves, where about 340 of them still remain, some of whom have been converted to Christianity. About 400 of the tribe are found in Ontario, Canada, and a few have joined the Senecas and Tuscaroras. They number about 860 in all.

ONSLOW, a co. in s.c. North Carolina, bounded on the s.c. by the Atlantic ocean, watered by the New river; about 700 sq.m.; pop. '80, 9,829. The surface is even, much of it swamp or sandy barrens. The soil is fertile, and produces good crops of Indian corn, sweet-potatoes, rice, and cotton. Tar and turpentine are manufactured. Co. seat, Jacksonville.

ONSLOW, GEORGE, 1784–1853; b. France; descended from a noble English family, son of hon. Edward Onslow, the youngest son of the earl of Onslow, who married a French lady and settled in France. He married a wealthy lady of Rouen, was rich himself, and passed his life in elegant retirement on his estate near Clermont. Devoting his time to the study of music, in which he had been carefully instructed by Dussek, Cramer, and Hullmandel, on the piano-forte, and in harmony and composition by the celebrated Reicha, a professor of the conservatoire. He cultivated his talent with such success that he early won distinction among the artists of his time. He was the author of a number of concertos for the piano-forte with orchestral accompaniments, quintets, quartets, symphonies, and sonatas, which are still performed. The most esteemed are his quintets for 2 violins, viola, and two violoncellos. He wrote in 1824 *L'Alcalde de la Vega*, and in 1827 *Le Colporteur*, both operas being well received, and in 1837 *Le Duc de Guise*. He was a member of the academy of fine arts, being the successor of Cherubino, and when he died, Haleny pronounced his eulogy.

ONTA'RIO, the easternmost and smallest of the five great lakes of North America, lies in 42° 10′ to 44° 8′ n. lat., and 76° 30′ to 80° w. long. At its s.w. corner it receives the waters of the upper lakes by the Niagara, and at its n.e. corner it issues into the St. Lawrence; which for some distance below is called the lake of the Thousand Isles. Its surface, which varies a few feet with the seasons, is about 330 ft. below that of lake Erie and 234 ft. above tide-water. Its bottom, therefore, must be considerably lower than the level of the Atlantic, as it is in some places 600 ft. deep. It is 190 m. long, 55 in its widest part, and about 480 in circumference. Sufficiently deep throughout for vessels of the largest tonnage, it has many convenient and thriving ports, of which the chief are Kingston, Port Hope, Cobourg, Toronto, Hamilton, on the Canadian shore, and Oswego, Sackett's Harbor, Port Genessee in the United States. Its navigation has been facilitated by the erection of 15 light-houses on the American side, and 13 on the Canadian; while it is connected with lake Erie by the Welland canal, with the Erie canal and New York by the Oswego canal, and by the Rideau canal with the Ottawa. Lake Ontario is subject to violent storms, and it is probably owing chiefly to the constant agitation of its waters that it freezes only for a few miles from the shore. The shores of lake Ontario are generally very flat, but the bay of Quinte, a long, crooked arm of the lake, which stretches about 50 m., possesses some attractive scenery. Burlington bay, on which Hamilton lies, is a large basin, almost inclosed by a natural, but strangely accumulated bank of sand, which forms a beautiful drive.

ONTARIO, the province. See CANADA.

ONTARIO, PROVINCE OF, formerly Upper Canada or Canada West, the most populous province in the Dominion of Canada. On the n.e. and e. it is bounded by the province of Quebec; on the s.e. and s.s.w. by the St. Lawrence river, the great lakes, and the district of Keewatin; and on the n.w. and n. by Hudson's bay and the North-West territories. Its length from s.e. to n.w. is about 750 m.; from n.e. to s.w. about 500 m.;

area 107,780 sq. miles. The face of the region is diversified by rivers and lakes. A ridge of high land extends in the s.e. portion from Niagara falls n.w. to lake Huron and along the peninsula between that lake and Georgian bay. Other ranges of hills are the Laurentian, crossing the Ottawa river at Quebec, and extending s. and thence w. to Georgian bay; and the Blue mountains, s. of Georgian bay, which attain a height above lake Huron of 1900 feet. The slopes are generally gradual and the valleys wide. In the s.w. lies a great plain, extremely fertile and valuable, underlaid by Silurian and Devonian limestones, sandstones, and shales, on which are found beds of clay and gravel. Much of this region abounds in hard-wood forests, and is fertile in wheat, corn, and all kinds of farm products. The principal rivers of the province are the tributaries of the Ottawa river, which forms the boundary between Ontario and the province of Quebec; the French, the Maganetawan, the Severn, and the Nottawasaga, falling into Georgian bay; the Saugeen, the Maitland, and Aux Sables, falling into lake Huron; the Thames, running s. into lake St. Clair; the Grand, flowing s.e. into lake Erie; the Trent, in part of its course called the Otonabee, and the Moira, flowing s.e. into the bay of Quinte; and the Niagara, falling into lake Ontario. The great lakes Superior, Huron, Erie, and Ontario, with their connecting waters, afford a water front to the province of about 3,000 m., with many good harbors. The principal minor lakes are Nipigon, Simcoe, and Nipissing; and the chief bays are the Georgian, Nottawasaga, Owen sound, Long Point, Burlington, and Quinte. The winters throughout the country are very cold, and the heat during summer is occasionally extreme; but the climate is considered healthy.

Ontario, like the rest of Canada, was first settled by the French, and together with the province of Quebec passed into the control of the English in 1760. It became a separate province in 1867. It is divided into 49 counties, subdivided into 88 electoral districts. The principal cities are Toronto, the capital, pop. 96,415; Ottawa, the capital of the dominion, pop. 27,417; Kingston, pop. 14,093; Hamilton, pop. 35,965; and London, pop. 19,746. The largest towns are Brantford, 9,616; St. Catherines, 9,631; Belleville, 9,516; Guelph, 9,890; Chatham, 7,873; St. Thomas, 8,367, and Stratford, 8,239. In 1881 the total population of the whole province was 1,923,228: 627,262 were Irish; 535,835 English; 378,536 Scotch; 188,394 German; 102,743 French; 22,163 Dutch; 6,397 Welsh; and 15,325 Indians. In the year '71, 228,708 persons were engaged in agricultural pursuits; 29,082 in commercial occupations; 26,085 in domestic; 93,871 in industrial, 16,759 in professional; and 68,199 were not classified. The greatest number of the inhabitants are settled in the s. and s.w. parts of the province; and, as the foregoing statistics indicate, agriculture is the chief occupation. A large proportion of the soil is of excellent quality, and in the s.w. the influence of the surrounding bodies of water aids the natural richness of the soil. Large crops of wheat are raised, also oats, barley, Indian corn, rye, potatoes, turnips, etc.; and in the s.w. the apple-orchards are very productive; and pears, plums, grapes, cherries, and various kinds of berries thrive. The regions lying between the Ottawa river and the Georgian bay contain large tracts of fertile ground, and produce a variety of timber consisting chiefly of white and red pine. In this district lumbering is extensively carried on, and the sawing of timber is among the principal industries of the province. Chief among the other manufactures are cotton and woolen goods, linen, furniture, iron and hardware, paper, soap, starch, hats, boots, and shoes, steam-engines and locomotives, sewing machines, wooden-ware, and agricultural implements. The foreign trade in 1883 in exports amounted to $32,890,619, and in imports to $44,452,804. The principal merchandise imported was sugar, tea, coal, Indian corn, wheat, iron manufactures, and cotton and woolen goods.

In railroads the province has made great progress during the past 15 years. In 1878 there were 3,528 m. of road in operation, with about 1000 additional m. either under charter or in process of construction. Chief among these were the Canada Southern; the western division of the Grand Trunk; and the Great Western. There are also a number of canals, the principal of which are the Welland, 28 m. long, from Port Dalhousie to Port Colborne; and the Rideau, from Kingston to Ottawa, 126 miles.

The school system affords all children free education, and is under the general management of a chief superintendant. Besides the common schools, the law provides for the establishment and maintenance of classical and English high schools for both sexes; and collegiate institutes. In 1873 there were 4,562 common schools; 108 high schools; 265 academies and private schools; 170 Roman Catholic separate schools. The province has some 5,000 educational establishments, including about 20 so-called colleges. The average amount paid by the department of education to separate (R. C.) schools in 1884, was over $14,000; the expenditure for payment of teachers of these schools, $91,702. The number of newspapers and periodicals published in the dominion is over 500, and of these, the majority are published in the province of Ontario. The prevailing religious denomination is the Methodist, which in 1881 had 591,403 adherents. Among the other leading denominations were: Baptist, 106,680 members; Episcopal, 366,539; Presbyterian, 411,479; and Roman Catholic, 320,839. The M. E. church in Canada and the British M. E. church each have a bishop. The Anglicans have three dioceses—Toronto, Ontario, and Huron. The Roman Catholics have an Archbishop at Toronto, and bishops at London, Hamilton, Kingston, and Ottawa.

The provincial government is administered by a lieutenant-governor, appoinsed by a governor-general of the Dominion for five years, assisted by an executive council of

five members, which includes an attorney-general, commissioner of agriculture, secretary, registrar, treasurer, commmissioner of crown lands, and commissioner of public works. The legislative assembly has only one house of 82 elective members. Voting is by ballot, and the right of suffrage is conferred on all male British subjects 21 years of age, possessed of some property qualification. The judicial power is vested in a court of error and appeal, a court of queen's bench, a court of common pleas, a court of chancery, and minor courts. In the dominion parliament the province of Ontario is represented by 24 senators and 88 members of the house of commons. See CANADA, *ante.*

ONTARIO, a co. in w. New York, having Seneca lake for its s.e. boundary, Canandaigua lake, 16 m. long, on the s., drained by Flint, Honeoye, and Mud creeks, and Canandaigua outlet; 640 sq.m.; pop '80, 49,377—41,739 of American birth, 589 colored. The surface is composed of hills and valleys, and crossed by high ridges furnishing excellent pasturage, and in some portions covered with groves of ash, beech, elm, sugar-maple, and forests of hard-wood timber. It is intersected by the New York Central and Hudson River and the Northern Central railroads; and the s. terminus of the Sodus Point and Southern railroad is at Canandaigua. The shores of its picturesque lakes, Canandaigua and Seneca, are attractive for summer resort; and the smaller bodies of water, lakes Honeoye, Canadice, and Hemlock, are noted for their beauty. Its soil is a fertile sandy loam with a mixture of clay in some places; having a foundation of limestone and sandstone, and deposits of gypsum and water-limestone. The country is suited to stock-raising, and every variety of grain is produced; also fruit, wool, dairy products, potatoes, and hops. The leading industries are the manufacture of cooperage, saddlery, agricultural implements, tin, copper, and sheet iron ware, bricks, carriages, and wagons, iron castings, leather, malt, woolen goods, lumber, and flour. Co. seat, Canandaigua.

ONTARIO, a township of Wayne co., N. Y.; consisting of the villages of Ontario and Ontario Center, situated on the Ontario Shore branch of the Rome, Watertown, and Ogdensburg railroad; 50 m. from Oswego; pop. '80, 2,962. There are foundries, and railroad machine and repair shops. It is the center of a large fruit-growing region.

ONTENIENTÉ, a t. of Spain, in the province of Valencia, 45 m. s. by w. from Valencia, on the right bank of the Clariano, and near the railway which connects Valencia with Madrid. Linen and woolen fabrics are manufactured here; there are also numerous oil-mills. Pop. 9,508.

ONTOLOGY. See METAPHYSICS.

ONTONAG'ON, a co. in extreme n.w. Michigan, bounded n.w. by lake Superior, s.w by Wisconsin; drained by the Montreal, Ontonagon, Fire Steel, Iron, Presque isle and Black rivers; 2,300 sq.m.; pop. '80, 2,565. The surface is rugged and covered with forests. The mining of copper and iron is the chief employment. Co. seat, Ontonagon.

ONUS PROBANDI, i.e., the burden of proof, is often a difficult question in litigation; but, as a general rule, the plaintiff who institutes the suit is bound to give proof of the allegations on which he relies. There are many nice and technical rules on the subject, both in suits and actions, which are too minute to be here stated.

ONYX, an agate formed of alternating white and black, or white and dark-brown stripes of chalcedony. More rarely, a third color of stripes occurs. The finest specimens are brought from India. Onyx is in much esteem for ornamental purposes. The ancients valued it very highly, and used it much for cameos. Many of the finest cameos in existence are of onyx. The name onyx, however, appears to have been applied by the ancients more extensively than it now is, and even to striped calcareous alabaster, such as is now called onyx marble. The *sardonyx* of the ancients is a variety of onyx, in which white stripes alternate with stripes of a dark-red variety of carnelian, called *sard* or *sarda.* It is one of the rarest and most beautiful kinds of onyx, and is more valued than carnelian.

ONYX MARBLE, a very beautiful material, which first came into general notice in this country in 1862, when the French made a large display of it in the international exhibition. It is a stalagmitic formation, which was discovered by the French in making roads in the province of Oran in Algiers. It is a translucent limestone, containing traces of magnesia and carbonate of iron; its specific gravity is 2.730. The quarries are worked by a company, and the artistic workmen of France are turning it to good account, in the manufacture of very beautiful ornamental works.

OOJEIN. See UJEIN.

OOLITE (Gr. egg-stone), a variety of limestone, often very pure calcareous spar, distinguished by its peculiar structure, being composed of grains connected together by a calcareous cement; the whole much resembling the roe of a fish. The grains are not unfrequently hollow. Many oolites, as in the south of England, are excellent building-stones. There is no important mineralogical differences between oolite and *pisolite,* or pea stone. Oolite, as a geological term, is extended far beyond its mineralogical and original signification.

OOLITE or JURASSIC **GROUP** (in Geology), an extensive and important series of strata of secondary age, underlying the chalk formation, and resting on the trias. In Britain

they received the name Oolite because in the district where they were first examined and described by Dr. W. Smith, the limestones contained in them had an oolitic structure (see foregoing article). The name Jurassic has been given to them on the continent because the range of the Jura mountains in the n. w. of Switzerland is almost entirely composed of them. The strata of the group have been arranged in the following order. The maximum thickness of each division is given in feet:

	Feet.
Upper Oolite.	
1. Purbeck beds	200
2. Portland beds	170
3. Kimmeridge clay	600
	970
Middle Oolite.	
4. Coral rag	190
5. Oxford clay	600
	790
Lower Oolite.	
6. Cornbrash and forest marble	80
7. Great oolite and stonesfield slate	150
8. Fuller's earth	150
9. Inferior oolite	250
	630
Lias.	
10. Upper lias	300
11. Marlstone	200
12. Lower lias	600
	1100
Total	3,490

It is apparent from this table that the oolitic rocks consist of three extensive clay deposits, each of which forms the basis of a smaller and variable set of sands and limestones; the upper oolites resting on the Kimmeridge clay, the coral rag on the oxford clay, and the lower oolite on the lias.

1. The Purbeck beds, unlike the other oolitic rocks, are chiefly freshwater deposits. Though lithologically they are very similar throughout, the peculiarities of the contained fossils have caused them to be grouped into three series—upper, middle, and lower. The upper Purbecks are purely fresh-water, containing beds of limestone and shale, which abound in shells of lake and river mollusca and cyprides. The stone called Purbeck marble, formerly so extensively used in the ornamental architecture of English churches and other buildings, belongs to this division; it consists of the shells of Paludinæ, held together by a somewhat argillaceous paste. The middle Purbecks are partly fresh-water, and partly brackish or marine. The "cinder-bed," composed of a vast accumulation of shells of *Ostrea distorta*, occurs in this section, and near it is the narrow layer from which Mr. Beckles recently obtained the remains of several mammalia. The lower Purbecks are chiefly fresh-water, with some intercalated brackish or marine beds, and one or two old vegetable soils called by the quarrymen "dirt-beds," which contain the stems of cycadaceous and coniferous plants. 2. The Portland beds consist of oolitic and other limestones interstratified with clays, and passing below into sands and sandstones, from which the well-known building-stone is obtained, of which St. Paul's and many of the principal buildings in London are built. 3. The Kimmeridge clay is generally a dark-gray bituminous shale, with intercalated beds of sand, calcareous grit, and layers of septaria. The dark shale in some places passes into an impure brown shaly coal. 4. The coral rag contains, as its name implies, an abundance of corals, in bluish limestone beds mixed with layers of calcareous grit. The Solenhofen lithographic stone, with its beautifully preserved and varied fossil remains, belongs to this division. 5. The Oxford clay is a dark-blue or blackish clay without corals, but having a large number of beautifully preserved Ammonites and Belemnites. Beds of calcareous sandstone, called Kelloway rock, occur in its lower portion. 6. The cornbrash consists of thin beds of cream-colored limestone, with sandstones and clays, and the forest marble (so named from Wychwood forest) is composed of an argillaceous limestone, with numerous marine fossils, blue marls and shales, and yellow silicious sand. At Bradford, Wiltshire, the forest marble is replaced by a considerable thickness of blue unctuous clay. 7. The great oolite is composed of shelly limestones, sandstones, and shelly calcareous sandstones, and the Stonesfield slate is a slightly oolitic shelly limestone, which splits into very thin slabs, erroneously called "slates:" it is

OOLITE GROUP.—1. Belemnites : *a*. giganteus ; *b*. hastalus. 2. Nautilus Danicus. 3. Apiocrinites rotundus. 4. Jurassic sea with its corals. 5. Pterodactylus crassirostris. 6. Plesiosaurus dolichodeirus. 7. Ichthyosaurus communis. 8. Coprolite of an ichthyosaurus. 9. Rynchonella lacunosa. 10. Ammonites amaltheus. 11. Gryphæa incurva. 12. Hippurites bioculata. 13. Cardium Hillanum. 14. *a* and *b*. Terebratula plicatilis. 15. Spondyllus spinosus. 16. Crioceras Duvalii. 17. Diceras. 18. Thecidea. 19. Iguanadons. 20. Terebratula diphya. 21. Serpula gordialis. 22. Spatangus coranguinum. 23. Cidaris clavigera. 24. Turrulites catenatus. 25. Ancyloceras Matheronianus. 26. Nonioninaschalen.

remarkable for the remains of terrestrial reptiles and mammals found in it. The Bath oolite, a celebrated building-stone, belongs to this division. 8. The fuller's-earth group is a local deposit found near Bath; it consists of a series of blue and yellow shales and marls, some of which have properties fitting them for the use of the fuller. 9. The inferior oolite is composed of a series of beds of pisolitic and shelly limestones, brown marl, and brown sandy limestone, all abounding in fossils. 10. The lias (q.v.) is a great clay deposit. It is divided into the upper and lower lias, which consist of thin beds of limestone scattered through a great thickness of blue clay, and, separating these two groups, the marlstone, or calcareous or ferruginous sandstone. The lias abounds in beautifully preserved fossils.

The oolite occupies, in England, a zone nearly thirty miles in breadth, extending across the country from Yorkshire to Dorsetshire. In Scotland, patches of lias and Oxford clay occur in the islands of Mull and Skye, and on the western shores of the mainland, and beds belonging to the lower oolite are found at Brora, on the east coast of Sutherland, which contain an impure coal. The only oolite rocks in Ireland are a few isolated patches in Antrim, which abound with the fossils of the lower lias. On the continent, rocks of this age occur in Germany and France, but they have been most extensively studied in the Jura mountains, which, though having a height of 6,000 ft. are entirely composed of oolite and cretaceous rocks. The strata are greatly bent and contorted, and as they approach the Swiss Alps, the great mass of which is also formed of oolite, they become completely metamorphosed into clay slates, mica schists, gneiss, and crystalline limestones. Beds of oolite have been noticed in Cutch, in India. In Australia similar beds occur on the western coast, and probably some of the coal-beds of New South Wales, Victoria, and Tasmania belong to the oolite. In both North and South America, fossils, apparently of oolitic age, have been found; but these deposits require to be more exactly examined.

The oolite is remarkable for the abundance of its fossils, and is in this respect in striking contrast to the immediately preceding Triassic and Permian periods. The several fresh-water deposits, and the ancient vegetable surfaces, contain the remains of a considerable number of plants. Ferns still abound, and with them are associated species that are evidently related to the living genera *cupressus*, *araucaria*, and *zamia*.

Corals abound in several of the beds. The brachiopods are the only division of the mollusca that is not largely represented. The conchifers and gasteropods show a great number and variety of new genera, which are nearer the forms of the present day than those that preceded them. But the remarkable feature of molluscan life is the enormous development of the cephalopods. Whole beds are almost entirely made up of their shells. No less than 600 species of ammonites have been described, chiefly from the rocks of this period, and the belemnites were also very numerous. The crinoids have become scarce, but are replaced by star-fishes and sea-urchins. The fresh-water beds contain the remains of many insect forms. The heterocercal-tailed fish give way to the more modern homocercals, and the true sharks and rays make their appearance, though the old cestracionts are still represented by some survivers. The characteristic feature of the oolitic period was its reptiles. The land, the sea, and the air had each their fitting inhabitants of this class. The various species of pterodactyles, some not larger than the bat, others surpassing, in the stretch of their membranous "wing," the size of the largest living bird, were the terrors of the air; while their allies, the monster ichthyosaurs and plesiosaurs, held the mastery of the waters; and the huge megalosaurs, some not less than 30 ft. in length, trod the earth. The few mammalian remains hitherto found have a special interest from their antiquity, being the first evidence of this high order of animals on the globe. They belong, apparently, to marsupial animals; one species is, however, supposed by Owen to have been a hoofed and herbivorous placental mammal.

OOMRAWUTTI, or AMRAWATI, an important commercial town of British India, in the province of Berar, 86 m. w. by s. from Nagpore, on one of the head-waters of the Purna, a branch of the Tapti. The district which contains it was ceded by the Nizam to the British government: and transit-duties, which formerly much interfered with the commerce of the town, have been abolished. Several considerable business firms are established here; and the chief merchants of upper India and of Bombay have agents, who often make advances to the cotton cultivators of the surrounding country, on security of their crop. There are large cotton warehouses at Oomrawutti. Pop. 23,410.

OONALASKA. See UNALASHKA.

OORALSK. See URALSK.

OORFA. See URFA.

OORGA. See URGA.

OORI, or LIMPOPO RIVER, an important river system of south-eastern Africa, rising in lat. 26° s. in the high plateau called the Magaliesberg, which forms the northern limit of the basin of the Orange river. Throughout a great part of its course, the Limpopo bounds on the n. the Transvaal territory which its southern affluents drain. It flows in a north-easterly direction through the plateau in which it rises, then turns sharply to the s.e. and s., when it enters the lowlands. It reaches the Indian ocean about 100 m. n. of Delagoa—considerably further s. than was till recently believed. Its course cannot be

less than 800 or 900 m. long, and it has numerous large tributaries, the Mariqua, Lipalula, etc. Yet, like most South African rivers, it is navigable only 60 m. from its mouth, which is blocked by a double bar.

OOROOMEYAH, town and lake. See URUMEYAH.

OOSTERHOUT, a flourishing town in the Netherlands, province of North Brabant, 6 m. n.n.e. from Breda, is situated in a well-wooded, fertile district of country. Pop. '79, 9,853, of whom 8,425 belonged to the Roman Catholic church. Much business is done in the grain and cattle markets. There are 14 tanyards, several flourishing beer-brewing establishments, 5 potteries, and 4 brick-works. Oosterhout has a grammar-school, and a nunnery, the inmates of which employ themselves in teaching the children of the poor. The handsome town-house and great Roman Catholic church stand on the market-place, which is shaded with linden trees.

Near Oosterhout is an extensive wood, where are the ruins of the house of Stryen or Oosterhout, formerly the residence of the counts of Stryen, under whose jurisdiction were not only the town and barony of Breda, but also the marquisate of Bergen-op-Zoom.

OOTACAMUND', the chief town in the Neilgherry hills, and the great sanitarium of southern India. These hills are situated between 11°—12° n. lat., and 76°—77° e. long. The elevation of Ootacamund' is 7,400 feet above the sea; the mean temperature being about 49°, the maximum 77°, and the minimum 38°. The average rainfall is 45 inches. Its distance is only about 350 m. from Madras, and it is easy of access, as the railway now conveys the traveler to the foot of the hills. The other stations on the Neilgherries are Coonoor, Kottagherry, and Jackatalla, or Wellington. In the last place there is a fine range of barracks for European troops. The number of European settlers on these hills is increasing. There are thriving plantations of tea and coffee, and the cinchona or quinine plant. Pop. '72, 9,982.

OOTRUM, an Indian fiber, derived from the stem of *dæmia extensa*, a plant of the natural order *asclepiadiaceæ*, abundant in many parts of Hindustan. The fiber is soft, white, silky, and strong, and is regarded as a promising substitute for flax.

O'PAH, or KING-FISH, *Lampris guttatus* or *L. luna*, a fish of the dory (q.v.) family (*zeïdæ*), occasionally found in the British seas, but more common in more northern regions, and found not only in the Atlantic and Arctic oceans, but also in the Pacific, as on the coasts of China and Japan. It is of an oval form, greatly compressed, with small thin scales, the mouth small and destitute of teeth, a single dorsal fin much elevated in front and extending almost to the tail. This fish attains a large size, being sometimes 5 ft. long and 150 lbs. in weight. It is brilliantly colored; the upper part of the back and sides rich green, reflecting purple and gold in different lights, the lower parts yellowish-green; round yellowish-white spots above and below the lateral line; all the fins bright vermilion. The flesh is much esteemed; it is red like salmon, and is said to resemble it in flavor.

O'PAL, a mineral which differs from quartz in containing from 5 to 13 per cent of water, its only other essential constituent being silica, although a little alumina, oxide of iron, etc., is often present. It is never found crystallized, and does not exhibit a crystalline structure like quartz. It has a conchoidal fracture, and is very easily broken. There are many varieties, which pass into one another, so that their precise limits cannot be defined, from which has arisen no little confusion of names. The finest kind is called *precious opal* or *noble opal*, and sometimes *oriental opal*. It is semi-transparent or translucent, usually of a bluish or yellowish white color, yellow by transmitted light, and exhibits a beautiful play of brilliant colors, owing to minute fissures which refract the light. It is much valued for setting in rings, brooches, etc., and is polished with a convex surface, never cut into facets, both because of its brittleness, and because its play of colors is thus best exhibited. The ancients valued opals very highly. The Roman senator Nonius preferred exile to giving up an opal to Mark Antony. This opal was still to be seen in the days of Pliny, who ascribes to it a value equal to more than £100,000 sterling. The imperial cabinet of Vienna contains the most celebrated opal now known to exist. It is 5 in. by 2½ inches. The finest opals are almost all brought from Kaschau in Hungary, where they are found disseminated in a trachytic conglomerate. They are mostly very small, but even a very small opal, if really beautiful, is worth four or five pounds; and the price increases very rapidly with increase of size. Precious opal is found also in Saxony, in South America, etc. When the colors are not equally diffused, but in detached spots, jewelers call it *harlequin opal*. There is a dark or blackish variety, apparently tinged by oxide of iron, which occasionally exhibits very beautiful reflections, and is then much prized. *Girasol* (q.v.) and *cacholong* (q.v.) are varieties of opal. What lapidaries call *prime d'opal* is clay-porphyry, or other stone containing many small grains of opal. It is cut into slabs, and made into boxes and other ornamental articles; the stone which contains the opals being often artificially blackened by boiling in oil, and afterwards exposing to a moderate heat.—*Common opal* is semi-transparent, white, yellow, green, red, or brown, and does not exhibit any play of colors. It is not a rare mineral, and is chiefly found in clay-porphyry. *Semi-opal* is more opaque. *Wood*

opal is a petrifaction, and exhibits the form and structure of wood, the place of which has been taken by the siliceous mineral. *Hyalite* and *menilite* are varieties of opal.

O'PATAS, an Indian tribe about the Mayo and Yaqui rivers in s. Sonora, Mexico. They number about 30,000, are semi-civilized, and govern themselves. They are often employed by the state authorities to fight the Apaches.

OPELIKA, a t., the co. seat of Lee county, Ala.; 66 m. n.e. of Montgomery, 30 m. n.w. of Columbus; on the Alabama and Cincinnati, the Savannah and Memphis, and the Western Alabama railroads; pop. '80, 3,245. There are factories of chairs, blinds, and carriages; a bank, 2 weekly papers, and 7 churches. The town is the center of a large country trade.

OPELOU'SAS, chief t. of St. Landry's parish, Louisiana, situated on Vermilion river, 50 m. w. of Baton Rouge, 217 m. n.w. of New Orleans; pop. '80, 1,676. There are a court-house, 2 banks, 3 weekly papers; and it is the seat of 2 convents. Large quantities of cotton are shipped up the river from this point.

OPEN-BILL, *Anastomus*, a genus of birds of the heron family (*ardeidæ*), natives of the East Indies and of Africa, remarkable for the structure of the bill, the mandibles being in contact only at the base and tip, with a wide interval between their edges in the middle. They frequent the sea-coast and rivers, and prey on fish and reptiles. One species is well known in India as the Coromandel heron.

OPEN DOORS, Letters of, in Scotch law mean a writ authorizing a messenger to poind or seize goods deposited in lockfast-places, and to break open the locked doors in order to effect the seizure. See House.

OPERA, a musical drama, in which music forms an essential part, and not a mere accessory accompaniment. As in the higher drama, poetry supersedes the prose of ordinary life, so in the opera, with perhaps as great artistic right, the language of music is introduced at a considerable sacrifice of probability. The libretto or words are, in the modern opera, a peg on which to hang the music, rather than the music an accessory to the written drama. The component parts of an opera are recitatives, duets, trios, quartets, choruses, and finales, accompanied throughout by an orchestra, and the whole is preceded by an instrumental overture (q.v.). Recitative is declamation, which, in its succession of musical sounds and rhythm, strives to assimilate itself as much as possible to the accents of speech, and therefore does not entirely conform to musical rhythm. The accessories of scenic representation are also present, and a ballet (q.v.) is also frequently introduced. In some of the German operas, and in the French *opéra comique*, spoken dialogue without music takes the place of recitative. Among the different varieties of the opera enumerated are the great opera or *opera seria*, of a dignified character; the romantic opera, embracing an admixture of the grave and lively; the comic opera, or *opera buffa;* as well as many intermediate varieties.

The idea of the opera may in part have arisen from the Greek drama, which possessed, to a considerable extent, the operatic character: the choral parts were sung, and the dialogue was delivered in a sustained key, probably resembling operatic recitative more than ordinary speech. The earliest extant example of any composition resembling the lyric drama of the moderns is Adam de la Hale's comic opera of *Li gieus* (*le jeu*) *de Robin et de Marian*, composed in the 13th c., the music of which is wonderful for its date. The next appearance of anything like opera is in the 16th c., when various musical dramas were composed in the madrigalesque style. An opera composed by Zarlino is said to have been performed at Venice when Henry III. passed through that city on his way from Poland to France. About the same time a pastoral called *Dafne*, written by the poet Rinucci, was set to music by Peri; and the same poet and musician conjointly produced the lyric tragedy of *La Morte di Euridice*, which was represented at the theater of Florence in 1600. Claudio Monteverde, one of a society of amateurs known as the "Florentine academy," who devoted themselves avowedly to the study and revival of Greek music, soon afterwards produced his *Orfeo*, a "*favola di musica*," in whose performance an orchestra of no fewer than 36 performers was called into requisition, most of the instruments being, however, only used in twos or threes, and never more than ten at a time. From these beginnings, the opera advanced into one of the permanent institutions of Italy—a development of music at first strongly opposed in character and style to the music of the church. With the progress of music, and the perfecting of the musical instruments which went to form the orchestra, the lyric drama began, towards the middle of last century, to approach its present character. Of the innumerable Italian operas of last century, only Cimarosa's *Matrimonio Segreto* retains its place on the stage. Cherubini, the first of the more modern school, after producing his *Quinto Fabio* at Milan, became naturalized in France: Rossini, who succeeded him in Italy, is the greatest name in the Italian opera. Nothing can exceed the deliciously fresh character of the best-known operas of this truly great musician, *Il Barbiere di Siviglia; Otello; La Gazza Ladra; Semiramide;* and *Guillaume Tell.* Next to them rank the equally well-known works of Bellini, *Norma; La Sonnambula;* and *I Puritani;—Lucia di Lammermoor; Lucrezia Borgia;* and *L'Elisir d'Amore*, the three *chefs-d'œuvre* of Donizetti, alone rivaling them in public estimation. A newer school of opera has recently sprung up in Italy, more grand if less fresh, of which the chief master is Verdi, whose *Ernani; Nabuchodonosor; I Lom-*

bardi; Otello; Rigoletto; Il Trovatore; La Traviata, and others have attained immense popularity in Italy, and wherever the Italian opera has been naturalized.

From Italy the opera was introduced into Germany, where, more scientific and less sensuous than in Italy, it flourished in opposition to national as well as ecclesiastical music. Germany divides with Italy the honor of perfecting orchestral music and the opera. Glück, educated in Italy, produced his *Orfeo* in Vienna, and then went to Paris, where the French adopted him as we did Handel. Mozart was the first composer of operas for the modern orchestra; *Idomeneo, Il Seraglio, Le Nozze di Figaro, Don Giovanni,* and *Zauberflöte* are his principal operatic works, unsurpassed by anything that has succeeded them. The most important German operas composed since their date are *Fidelio* by Beethoven; *Der Freischütz, Euryanthe,* and *Oberon* by Weber; *Faust* by Spohr; and the gorgeous operas of Meyerbeer—*Robert le Diable, Les Huguenots* and *Le Prophète,* and *L'Étoile du Nord. Les Huguenots,* notwithstanding its involving enormous difficulties in representation, keeps its place in every operatic theater in Europe. Wagner, the chief exponent of a more recent school, generally known as that of the "music of the future," has produced the operas of *Tannhäuser, Lohengrin,* etc., which enjoy at present a large share of public favor in Germany, and have also become known in England.

In France, the earliest operatic representation of which we have any record was in 1582. About 1669 the abbot Perrin obtained from Louis XIV. the privilege of establishing an opera in the French language at Paris, and in 1672 the privilege was transferred to Lulli, who may be considered the founder of the French lyrical drama. Lulli's popularity continued during a long period, and was only put an end to by the rise of the German Glück, who, naturalized in Paris, produced there his *Iphigènie in Aulide* and *Alceste.* It is greatly through Glück's influence that the modern French opera has become what it is, a composite work combining French, German, and Italian elements. Its best-known productions include Méhul's *Joseph,* Halévy's *Juive,* Auber's *Masaniello, Fra Diavolo,* and *Diamans de la Couronne,* and Gounod's recent opera of *Faust.* The Italian opera, introduced in Paris in 1646 by cardinal Mazarin, and superseded in 1670, was revived in the beginning of the present century, and has since flourished side by side with the national opera of France.

The possibility of a national English opera seems first to have been shown by Purcell, who through Humphreys, had learned much from Lulli. His music to Dryden's *King Arthur* is very beautiful, though kept throughout subordinate to the business of the drama. *The Beggar's Opera,* as set to music by Dr. Pepusch, was a selection of the airs most popular at the time. It has retained its place on the stage, as also has Dr. Arne's *Artaxerxes,* a translation from Metastasio adapted to music rich in melody. The importation of the Italian opera put a stop, for a time at least, to the further development of an opera in England. In 1706 *Arsinoë,* with English words adapted to Italians airs, was performed at Drury Lane. In 1710 *Almahide,* wholly in Italian, was performed exclusively by Italian singers at the Haymarket theater; and a succession of attempts of the kind ended in the permanent establishment of the Italian opera. The arrival of Handel in England decided the future progress of the opera. That great master was during the greater part of his life an opera composer and opera manager. He composed for the London stage no fewer than 44 operas, German, Italian, and English. These now forgotten operas were of course not the complex compositions of a later period, which could not have been performed in the then imperfect state of orchestral instruments. A recitative was set to music nearly as fast as the composer could put notes on paper, and the songs were accompanied in general by only one violin and bass, the composer sitting at the harpsichord, and supplying what was wanting. From Handel's time onwards, the opera flourished as an exotic in Britain the singers being foreign, and the works performed being either Italian or occasionally German or French. Attempts crowned with some measure of success have latterly been made to establish an opera of a national character in England. Balfe's *Bohemian Girl* and *Rose of Castile* are the best works which this school has produced, and have attained, with other operas by Balfe, Wallace, and Macfarren, a considerable measure of popularity. See Hogarth's *Memoirs of the Opera* (London, 1851); S. Edward's *History of the O.* (1862); Grove's *Dictionary of Music.*

SUPPLEMENT TO VOLUME X.

*An * indicates that the article to which it is prefixed is continued from the main work.*

MINOR, ROBERT C.: b. N. Y.: studied in Belgium, Italy, and France, being especially influenced by Rosseau, Daubigny, and Corot. He has made New York his home since 1875, and has been styled "one of the six poetic landscape painters of America." He has exhibited in the Paris *Salon*, the royal academy, and Grosvenor gallery in London, national academy of design and elsewhere in this country. Among his works are "The Vale of Kennet," "The Wold of Kent," and "Sundown."

MISCEGENATION: a mixture of races; a term applied especially to the amalgamation of the whites and the negroes. Some accurate observers say that the M., which the social conditions in the Southern states in the slavery days encouraged, is fast disappearing; and that the races will finally become as entirely distinct as they were originally.

*MISREPRESENTATION. It has been held in N. Y. (and the rule is generally the same in other states), that the forms adopted for the perpetration of frauds are of little importance, and that it matters not whether the false representations be made to the party injured or to a third party whose conduct is thus influenced, or whether it be direct or indirect in its consequences. While it is true that there is no fraud where a party, in making a false representation, was honestly mistaken, yet this rule does not permit one to affirm positively as to a fact without having some apparently good ground for the affirmation. To constitute legal fraud there must be either fraudulent M. of fact, or such conduct, for fraudulent purposes, as to mislead or to prevent inquiry. Mere silence as to extrinsic facts is not fraudulent, except where such relations of trust and confidence exist as to entitle one party to full information from the other. While it is true that M. as to property, connections, etc., will not avoid a contract of marriage, still if the party causing the deceit prevented the injured party from ascertaining facts which would have shown unchastity on the part of an intended wife or chronic disease of a severe nature on the part of either, there may be ground for annuling the marriage. As to M. in obtaining insurance, there must be a distinction taken between statements which are warranties and those which are only representations. No part of an application for insurance can be regarded as a warranty unless made so by the contract of insurance. The parts not adopted, and made the basis of the contract, so as to constitute warranties, are to be treated as representations, not prejudicing the rights of the insured, unless they are material to the risk and are untrue and were made not in good faith. If a warranty be untrue, however, the policy may be avoided whether it was material or not, and although innocently made; nor will it make any difference if the company's agent knew the true state of facts. But where a breach of warranty is relied upon by an insurance company as ground of forfeiture, the warranty is to be construed strictly against the company.

MISTASSINI: a large lake in North East territory, Canada, lat. 51° n., long. 72° to 73° w. The Indians claim an extravagant length for the lake, saying that three days must be employed in crossing the narrowest part from island to island. It is certainly very large; and an estimate based on good authority gives the length at 150 m.—not quite as large as Ontario. The actual width is unknown, but is estimated at 15 m. in the widest parts. Until recently it has been singularly unknown outside of an official circle. The Hudson's Bay Co., have a post on lake M., 333 m. north of Montreal. The lake is of great depth and abounds in fish; the surrounding country is level and well fitted for agriculture, while the woods are full of game; there is said to be mineral wealth in the vicinity; and the country is described as delightful, the winters being clear and cold, and the summers warm and short. The Indians are friendly.

MITCHELL: a co. in n.w. Texas; formed, 1876; unorganized, and attached to Shackelford co. for judicial purposes: 900 sq. m. Pop. '80, 117—5 colored.

MITCHELL, CHARLES LE MOYNE: b. New Haven, Conn., 1844: received an academical education; was a member of the State house of representatives, 1877; and was elected to the XLVIIIth congress as a Democrat; re-elected to the XLIXth.

MITCHELL, JOHN H.: b. Washington co., Penn., 1835: was admitted to the bar, and removed to Oregon, 1860; was a repub. state senator, 1862–66, and pres. of the senate, 1864–66; was prof. of medical jurisprudence in Willamette univ., Oregon, 1867–71. He was U. S. senator, 1873–79.

MITCHELL, MARGARET JULIA (popularly known as *Maggie*): b. New York, 1832. When a mere child she went upon the stage, but she made her first regular appearance as Julia in *The Soldier's Daughter* at the Chambers st. theater, New York, 1851; and soon afterwards became a "star." She married Mr. Paddock, 1867. Her favorite roles are "Jane Eyre," and "Fanchon, the Cricket."

MOBERLY: a city in Randolph co., Mo., at the junction of the Northern Division of the St. Louis Kansas City and Northern railroad, with the Missouri Kansas and Texas railroad; 23 m. s. of Macon. It contains a savings-bank, one other bank, 11 churches, manufactories of carriages, tobacco, and flour; also railroad machine-shops. Pop. '80, 6,070.

MODJESKA, HELENA: b. Cracow, Poland, 1844: married at the age of 16 years G. S. Modjeska, a theatrical manager many years her senior, and the next year appeared on the stage. In 1865 she became the leading actress in Cracow, and soon established a national reputation. Her husband, in the meantime, had died, and she married, 1868, Charles de Bozenta Chlapowski, with whom she soon afterwards emigrated to California, and settled on a farm. But after nine years the old passion for the stage again overcame her. She went with her husband to San Francisco, 1877, and studied the English language with such success that in Aug. of the same year she was able to appear in *Adrienne Lecouvreur* at the California theater. Her success was immediate, and was confirmed by a tour through the principal cities of the U. S. In 1880–1 she played in London, and then returned to the U. S.

MODOC: a co. in n.e. California, bordered by Oregon; formed in 1874; crossed by Pitt river, and containing several lakes; surface mountainous or undulating, with lava-beds, a notable feature. Pop. '80, 4,399—23 colored, 17 Chinese, 404 Indians. Co. seat, Alturas.

MOHAMMED HUSSEIN KHALIFA, Mudir of Dongola: b. abt. 1824: the most powerful of the Bedouin shieks of the Soudan. M. holds almost despotic sway over more than 70,000 Abaddehs and Bishareens, of which he is the chief. He comes of a long line of princes; has remained faithful to the Khedive; and is sometimes mentioned as the future gov.-gen. of the Soudan. He is required by the Khedive to dwell near Berber on the banks of the Nile, and to answer for the security of travel and trade through the eastern deserts.

*MONEY. By the provisions of § 3588 of the U. S. Rev. Stat., "U. S. notes shall be lawful money and a legal tender in payment of all debts, public and private, within the United States, except for duties on imports and interest on the public debt." The act of 1878, May 31, ch. 146 enacts as follows: "From and after the passage of this act it shall not be lawful for the sec. of the treasury or other officer under him to cancel or retire any more of the U. S. legal tender notes. And when any of said notes may be redeemed or be received into the treasury under any law from any source whatever, and shall belong to the U. S., they shall not be retired, canceled, or destroyed, but they shall be reissued and paid out again and kept in circulation." Under this act the question arose whether or not notes of the U. S. so reissued were a legal tender in payment of such debts as provided in § 3588 *supra*. The objection to their validity resting in the alleged unconstitutionality of the act of 1878, May 31, if it should be construed as giving to the U. S. notes required by the act to be issued, paid out, and kept in circulation, the incident or quality of legal tender—it was objected on the part of those attacking the act that the power of congress to make treasury notes a legal tender between private persons, if such power existed, arose solely upon the ground that it was justifiable as a war measure, necessary then perhaps as a means of averting national destruction, but otherwise unjustifiable. But the supreme court of the U. S. in what is known as the Legal Tender case, decided in 1884, March 3, declared that Congress has the constitutional power to make the treasury notes of the U. S. a legal tender in payment of private debts. in time of peace as well as in time of war; and that notes reissued under the act of 1878, May 31, were a legal tender. This decision is of considerable importance as marking the growing tendency of the court to assert the broadest possible powers of the U. S. government under the constitution. The eminent counsel engaged gave the subject very full discussion and a dissenting opinion by Justice Field sets forth very ably the views which are held in opposition to this decision. (See vol. 110 U. S. Reports, pp. 421–470.)

MONEY, HERNANDO DE SOTO: b. Holmes co., Miss., 1839: was educated at the univ. of Mississippi; studied law, but became a journalist. He was elected as a dem. to the XLIVth and four succeeding congresses.

MONOGUE, PATRICK, D.D.: b. Desart, Ireland, abt. 1835: emigrated to America early in life, and settled in New England. He was ordained a Rom. Cath. priest at

the Sulpician seminary, Paris, 1861. After laboring as a missionary and pastor for 20 years, he was consecrated coadjutor bp. of Grass Valley, Cal. and Nev., 1881; and bp., 1884.

*MOODY, DWIGHT LYMAN: during his second trip to England in 1882, was cordially received by the English clergy. Most of his work was done in the provinces, but he held large meetings also at the universities of Oxford and Cambridge with the co-operation of many officials and dignitaries of the Church of England. At Cambridge he at first met with much opposition, but fully overcame it. The results were remarkable: many students were seriously impressed, and a number of them, including some of the highest standing, devoted themselves to evangelistic and and missionary work. He also held meetings at Paris. Lately he has published two vols., *Heaven* and *Secret Power*. He is vigorously prosecuting a work of evangelical education at his home in Northfield, Mass., where through his personal efforts large buildings have been provided for two institutions under his management—the Northfield Young Ladies' Sem., and the Mt. Hermon Boys' School.

MOODY, ZENAS FERRY: b. Granby, Mass., 1831. When the gold fever broke out in 1848, he went to seek fortune in California, and thence to Oregon, 1859, where he established a miner's express, 1862, afterwards bought by Wells, Fargo & Co. Afterward he was prosperous in business; was elected as repub. to the Oregon assembly; chosen speaker; and elected gov. 1882.

MOORE: a co. in n.w. Texas; drained by the Canadian river; formed 1876; unorganized, and attached to Wheeler co. for judicial purposes: 900 sq. m.

MOORE, JOHN, D.D.: b. at Castletown, Delvin, co. Westmeath, Ireland, 1835: graduated at the Propaganda as D.D., 1860, and for 17 years held pastorates in S. Car. He was appointed bp. of St. Augustine, Fla., 1877.

MORA, FRANCIS, D.D.: b. near Vich, Spain, abt. 1833: studied theology at Vich; came to the U. S., and was ordained a Rom. Cath. priest, 1856. After holding several charges, he became rector of the pro-cathedral of Los Angelos, Cal., 1863; and vicar general of the diocese, 1865; was consecrated bp. of Mossynopolis and coadjutor bp. of Monterey and Los Angelos, 1873, and succeeded to the latter see, 1878.

*MORAINE. The great terminal M. in the U. S., marking the boundary between the glaciated and the non-glaciated part of the country, has been accurately determined in many portions of its extent. Beginning on the e. with the backbone of Cape Cod, it extends down to, and follows the backbone of Long Island across to Staten Island, thence across the state of N. J.; enters Penn. near Belvidere, takes first a w., and then n.w. course, crossing the Lehigh river a few miles n. of Mauch Chunk. It reaches up into the state of New York, then takes a s.w. direction, and re-enters Penn. Leaving Penn., it has been traced across O., Ind., and Ill. It has been found in Wis. and Minn.; but its western line has not been so accurately determined as the eastern.

MORGAN, JOHN T.: b. Athens, Tenn., 1824: removed in youth to Ala., and was admitted to the bar, 1845; was a delegate to the state convention which passed the ordinance of secession. He entered the confederate army as a private and rose to the rank of brig.-gen. After the war he resumed practice in Selma, Ala., and was elected as a dem. to the U. S. senate, 1876; re-elected, 1882.

MORGAN CITY, formerly *Brashear:* a town in St. Mary's parish, La.; on the e. bank of Atchafalaya bayou, 80 m. w. of New Orleans, with which it is connected by the Morgan Louisiana and Texas railroad; and connects with Galveston, Tex., by a daily line of steamers. It has considerable trade. Pop. '80, 2,015.

*MORMONS. In 1882, an act was passed by congress, known as the Edmunds bill, which in the main was directed to the exclusion of polygamists from office and from the polls; and a commission was appointed to carry out its provisions. The immediate effect of this bill was to disfranchise 12,000 polygamous Mormons in Utah. But because polygamy was was not at once extinguished, and because the elections that followed were carried by Mormons, monogamists in practice but polygamists in belief, so that the new legislature was as much in favor of the doctrine as the old, hasty criticism asserted that the bill would prove as futile as previous legislation against polygamy. But by those well informed in Utah affairs, it was not expected that the disfranchisement would have immediate effect. In a report made by the Utah commissioners to congress, 1883, they expressed great confidence in the final effect of the bill upon polygamy, saying among other things: "The very existence of the law disfranchising the polygamists must tend to destroy their influence, whenever it is understood that this is to be a permanent discrimination. Those Mormons who have the ballot will after a time be conscious of a power which they will be unwilling to use forever at the bidding of those who have it not. The fact also, that it will be necessary to the preservation of the political influence of the People's party (as the Mormons style themselves) to have a large body of their members who are not polygamists, must tend in time to weaken the practice of polygamy, for every unmarried Mormon who takes but one wife additional loses three votes for his party

—his own and those of his two wives (woman suffrage being established by law in Utah). Another consideration—its influence upon young men and the rising generation—is entitled to great weight. Seeing all the offices of honor, trust, and profit, such as delegate to congress, probate judges, sheriffs, etc., held by monogamists, while polygamists are wholly excluded, the aspiring young men of the territory would present an anomaly in human nature if they should fail to be strongly influenced against going into a relation which thus subjects them to political ostracism and fixes on them the stigma of moral turpitude." This report places in a strong light the final effect of disfranchisement; but there are clauses in the law whose effects upon polygamy have been prompt and immediate; such for instance as the clause which excludes from juries all persons who have practiced polygamy, or all who believe that it is right for a man to have more than one wife; and the clause which provides that if any one man in the territory lives with more than one woman in the marital relation he shall be deemed guilty of a misdemeanor. Formerly there was enough law in Utah for the suppression of polygamy but it was impossible to enforce it, because polygamists or their sympathizers sat upon juries; and testimony needed to establish polygamous marriage was suppressed. But under the present law some of the leading Mormons have been convicted, among them George Q. Cannon, the Mormon delegate to congress. But the great outcry which the Mormons in Utah have raised against the bill is the best proof of its power. Indeed, if Mormonism is dependent upon the doctrine of polygamy, undoubtedly Mormonism must go; but it must be remembered that the greater number of Mormons are not polygamists in practice, and that their belief in polygamy may change under the influence of the Edmunds bill. Also there is a large body of Mormons under the leadership of Joseph Smith, eldest son of the "prophet," who repudiate polygamy and denounce Brigham Young as a promulgator of false doctrines. This sect styles itself the "Reorganized Church of Jesus Christ of the Latter Day Saints," and holds that the legitimate successor to Joseph Smith was his eldest son; that the allegation that Smith introduced polygamy on the strength of divine revelation was an invention of Brigham Young; that the Utah church had departed from the faith; and that the Reorganized church is the true successor to the original church, and as such is legally entitled to all that church's property and rights. This legal right was recognized by the U. S. court of Ohio, 1883, which awarded to them a temple in Kirtland, consecrated in 1836, and over the right to the possession of which there had been a long litigation between the Reformed and Utah churches. The headquarters of the Reformed church are at Lamoni, Iowa, and it numbers altogether about 18,000 members. It sends missionaries to, and circulates tracts in, Utah, where it has maintained a mission since 1863. The Utah church numbers about 125,000 members in the territory, and altogether in America and Europe about 215,000.

MORRIS, Benjamin Wistar, D.D.: b. Wellsboro, Penn, 1819: graduated at the General theol. seminary, 1846; was ordained priest in the Prot. Epis. church, 1847; was rector of St. Matthew's church, Sunbury, and St. David's church, Manayunk; asst. minister at St. Luke's church, Germantown. He was consecrated miss. bp. of Oregon and Washington territory, 1868. His diocese now includes only Oregon.

MORRIS, Clara: b. Morrison, Canada, abt. 1848: was taken when young to Cleveland, O., where she made her first appearance at the Academy of Music, 1862. She resided in Cleveland for several years. Her first important part was "Theresa," in the *Orphan of Geneva*, acted in Buffalo, N. Y., 1866. She married Mr. Harriott, 1876. She is greatly admired in portrayals of emotional parts.

MORRISON, William R.: b. Monroe co., Ill., 1825. He received a public school education, and then attended McKendree coll., Ill.; was admitted to the bar, and was clerk of the circuit court; was a member of the Ill. house of representatives for four terms, and speaker for one term. He fought as a private in the Mexican war, and during the civil war was col. of the 49th Ill., infantry. He was elected as a dem. to the XXXVIIIth congress, and subsequently to the XLIIId–IXth congresses. He has distinguished himself in the house as an advocate of free trade principles; and it was chiefly through his support that John G. Carlisle was made speaker of the XLVIIIth congress. During this congress he introduced a bill "to reduce import duties and war tariff taxes," which became famous as the Morrison bill. It proposed a horizontal reduction of the tariff, and the placing of various articles upon the free list. The free traders and the protectionists among the democratic representatives divided upon this bill, and it was finally killed by four votes. He was appointed chairman of the committee on Ways and Means, 1884; and was chairman of the com. on resolutions which drew up the party platform at the dem. national convention, 1884.

MORRISSEY, John: 1831–78; b. Templemore, Tipperary co., Ireland. His parents emigrated to America, 1836, settling in Troy, N. Y., where M., on reaching manhood, opened a bar-room, and later a faro-bank. From 1849 to 1858 he was a professional pugilist, defeating many champions of the ring. He then opened a

gambling saloon in New York; became a noted Tammany politician; was elected to congress, 1865; re-elected 1868; established a magnificent gambling saloon in Saratoga, 1870; became one of the leaders of the anti-Tammany Democrats; and was elected by them to the state senate, 1874, and again 1877.

MORSE, LEOPOLD: b. Wachenheim, Bavaria, 1831: emigrated when young, became a merchant, and settled in Boston; was elected as a dem. to the XLVth and three succeeding congresses.

MORTON, LEVI P.: b. Vt., 1835. Early in life he was employed in business at Hanover, N. H., and after five years he removed to Boston. He settled in New York, 1854, and became one of the most successful of its business men; was elected as a repub. to the XLVIth and XLVIIth congresses. He was sent as an honorary commissioner to the Paris exposition, 1878; and was appointed minister to France by Pres. Garfield, 1881, serving until 1885.

MOSBY, JOHN SINGLETON: b. Edgemont, Va., 1833. He practiced law at Bristol, Va., until the civil war, when he entered the confederate service as a private. He made a name as a scout and a guerrilla, and became col. of the Partisan battallion, famous for its guerrilla raids. After the war he became a warm personal friend of Gen. Grant, and was appointed by him consul at Hong Kong, 1878.

MOST, JOHN: b. Augsburg, Bavaria, 1842: received a good common education. He is a violent socialistic agitator; has been imprisoned in Austria, Germany, and England. He published in London the *Freiheit*, a socialistic paper, and was there, 1881, tried and condemned to 16 months' imprisonment, upon the charge of inciting to murder. At the expiration of his term he came to the U. S., where he has made socialistic speeches in many of the cities.

MOTLEY: a co. in n.w. Texas; formed 1876; unorganized, and attached to Jack co. for judicial purposes: crossed by some sources of Red river: 900 sq. m. Pop., '80, 24.

MOTOGRAPH: an instrument by means of which musical notes may be transmited great distances over wires. The transmiting apparatus consists of a long tube with one end covered by a thin sheet of brass diaphragm, in the center of which a thin disk of platina is soldered. An adjustable screw, with a point of platina, is secured to a fixed pillar in front of the disk, and both it and the screw are fastened to an iron base. The receiving apparatus consists of a resonant box mounted on two short pillars; a flanged wheel fastened to a shaft easily moved by a handle; a reel back of the box containing a continuous strip of chemically prepared paper, which passes over the wheel as the handle is turned; a platina rod on the end of a spring secured to the box, pressing upon the paper, and conveying an electric current through it, and thence to the wheel, from which it is returned to the battery. The spring upon which the platina rod rests is so connected with the resonant box that one side of the latter is drawn out as the handle is turned. The friction ceases when the electric current passes through the paper, and the side of the box closes; and so for each vibration. The paper must be prepared chemically, and the plate on which it rests must be connected with the positive pole of the battery, while the negative pole is connected with the platina rod. When the current is in force the rod glides over the paper, and when it is interrupted there is considerable friction. The highest and lowest notes of the human register, as well as the softest sounds of instrumental music, can be heard in a large hall hundreds of miles distant from the transmiter. Mr. Edison is practically the inventor of the M., as we have it, although Reiss and Van Der Weyde originated the idea. The M. was first exhibited in Newark, N. J., 1877.

MOUNT GILEAD: a magisterial dist., Loudoun co., Va.; including Hamilton town. Pop. of dist., '80, 4,494.

MOUNT PLEASANT: a tp. in Westmoreland co., Penn.: traversed by the Mount Pleasant branch of the Pittsburgh Washington and Baltimore railroad; 32 m. s.e. of Pittsburgh. It contains coal-mines. Pop. '80, 4,224.

MOZOOMDAR, PROTAP CHUNDER: b. Calcutta, India, abt. 1840: studied in the Hindoo coll. in his native place, and was soon afterward led by a course of religious thinking to join the Brahmo-Somaj (q. v.), becoming a devoted friend and fellow worker of Keshub Chunder Sen (see SEN). In 1874 he visited England and conferred with Max Müller and other orientalists; and in 1883 he came to this country where he was welcomed by the leading representatives of several Christian denominations. He is the editor of the *Theistic Review and Interpreter*, pub. at Calcutta in the interests of the Brahmo-Somaj; has also contributed to English and American periodicals; and on his visit to this country published a book entitled *The Oriental Christ*, 1883.

MTESA, Emperor of Uganda, Africa: abt. 1835–83: consolidated a powerful kingdom about Lakes Albert and Victoria which he ruled with despotic sway. He was descended from the Wahuna chiefs, tracing his descent from Kiutu, the original

founder of the dynasty. He believed himself to be the greatest sovereign in the universe.

MUIR, Sir WILLIAM : b. at Glasgow, 1819 : studied at the universities of Glasgow and Edinburgh, and in 1836 went out to India, and entered the civil service, in which he rose to high distinction. He also became eminent as an orientalist. In 1885 he was appointed principal of the univ. of Edinburgh. He wrote, besides other works, a *Life of Mahomet and History of Islam* (1858, 4th vol. 1861 ; abridged edition, 1871) ; *The Coran* (1878), *The Early Caliphate* (1881), *Mahomet and Islam* (1884), etc.

MULEY-HASSAN. SIDI : b. 1831 : succeeded his father, Sidi Muley-Mohammed, as sultan of Morocco, 1873. In 1880 reports of shocking cruelties to the Jews in his dominions resulted in the calling of an international conference at Madrid by the king of Spain. The Sultan agreed to the protocol of the conference, calling for liberty of conscience in his dominions; but his incapacity or unwillingness to carry out any genuine reform left the condition of the Jews only slightly ameliorated.

MULFORD, ELISHA, D.D., LL.D.: b. Montrose, Penn., abt. 1835 : educated at Yale coll., at Andover theol. sem., and in Europe, where he spent two years in study and travel. He took holy orders in the Prot. Epis. church, and became rector of a parish in South Orange, N. J. He afterward lived in retirement at Montrose, Penn., spending his time in close study, the result of which was his book *The Nation ; the foundations of Civil Order and Political Life in the United States*, which has taken high rank among the social science works of the day. "It has entered," says the critic of the *Literary World*, "into all the best political thought of the age, and scarcely is there an able paper written, or speech made, touching the principles of our government, that does not show traces of the formative influence of this book." He is also the author of *The Republic of God*, a theological work of great originality and power ; a memorial article on Maurice, and some essays in reviews, etc. Dr. M. resides at Cambridge, Mass.

MULLEN, TOBIAS, D.D.: b Flushtown, Ireland, 1818 : was educated at the national schools, and entered Maynooth coll., 1840 ; came to America, 1843 ; was ordained a Rom. Cath. priest; and was consecrated bp. of Erie, Penn., 1868.

MUNGER, THEODORE THORNTON, D.D.: b. Bainbridge, N. Y., 1830 : educated at Yale coll., and Yale divinity school. He entered the Cong. ministry ; was pastor at Dorchester, Mass., Haverhill, and Lawrence ; and for some years has been pastor of the Cong. church at North Adams, Mass. Dr. M. has become widely known as a writer of fine discrimination and force on subjects pertaining to spiritual life, being especially happy in his treatment of scientific phenomena from metaphysical standpoints. He has written *On the Threshold*, *The Freedom of Faith*, *Lamps and Paths*, and *Immortality and Modern Thought*, the last a noticeable article in the *Century*, 1885, May, in which future existence is discussed in connection with Evolution. Most of these books have had remarkable success. *On the Threshold* and *The Freedom of Faith* were republished in London ; of the former, about 15,000 were sold, and of the latter, probably 20,000.

*MUNKACZY, MIHALY : 1844–85 : b. Munkaco, Hungary. His parents were shot before his eyes by the Russians, 1849 ; he was taken as an apprentice by a miller, and after a hard struggle with poverty was enabled to take lessons in landscape painting at Pesth. He subsequently studied art in Vienna, Munich, and Dusseldorf. In 1870 he exhibited at the Paris salon "The Last Days of a Condemned Man," which at once established his reputation. His best known paintings are mentioned in the main article.

*MURDER. In 1884, for the first time, the question came before the English courts whether the killing of a person from necessity to use his body for food in order to preserve life, is murder. The case is known as the "Mignonette case," from the name of a vessel involved. Two sailors, wrecked in an open boat, being on the verge of starving, killed one of their companions, and ate part of his body. On being picked up, and brought to England, they were indicted for M.: the facts being admitted, chief justice Coleridge, with the assent of the other judges, decided it to be M. Though recognizing the justification of necessity in some cases, the judge said : "It is not correct, therefore, to say that there is any absolute or unqualified necessity to preserve one's life. On the contrary, it is frequently our highest duty to sacrifice it." The prisoners were sentenced to death, but being recommended for mercy, their sentence was changed to six months' imprisonment.

MURFREE, MARY NOAILLES, known by her pen-name of Charles Egbert Craddock : b. Murfreesboro', Tenn., where her father was a prominent lawyer ; lived in Nashville during the civil war; some years afterwards returned to Murfreesboro', and in 1882 removed with her family to St. Louis. She began her literary career with a short story, *The Dancin' Party at Harrison's Cove*, contributed to the *Atlantic Monthly*, 1878, May. The freshness and vigor of this and subsequent sketches attracted much attention, which was increased when they were collected into a vol., *In the Tenneesee Mountains*, 1884. Two novels *Where the Battle was Fought* (1884),

and *The Prophet of the Great Smoky Mountains* (1885), and a juvenile, *Down the Ravine* (1885), have fulfilled the promise of her earlier tales. Not until 1885 did her publishers suspect that the genius of a woman was hidden under the name appended to her works.

MURPHY, FRANCIS: b. county Wexford, Ireland, 1836: emigrated to America at the age of 16 years, and obtained employment in a hotel at Montreal. He afterwards managed a large hotel at Portland, Me., but met with financial ruin as the result of intemperate habits. Awakened by the seriousness of his condition, M. determined to devote the remainder of his life to the temperance cause; and began a course of lectures in the various cities and towns, in which he has had great success. He has a fervid style, and a complete control over his audience; and much good is visible as the fruit of his efforts.

MURRAY, ROBERT, M.D.: b. Md. In 1846 he was appointed assistant surgeon in the army, and in 1851, he attained the rank of capt.; nine years afterward he was appointed surgeon, and held the rank of major; was appointed asst. medical purveyor with the rank of lieut.-col., 1866. 1883, Nov. 23, he was appointed surgeon-general of the army.

MUSSEY, WILLIAM H., M.D.: 1818–83; b. Hanover, N. H.; son of Reuben D.; d. Cincinnati, O.: graduated at the Ohio Medical coll., 1848; and subsequently studied in Paris. He settled in Cincinnati, and practiced as a surgeon; was vice-pres. of the American medical assoc., 1864, and subsequently of the Ohio State medical assoc.; and held various positions in hospitals and colleges; was commissioned brigade-surgeon, 1861, and lieut.-col. and medical inspector of the U. S. army, 1862, and for a number of years was surgeon-gen. of Ohio. He founded the Mussey medical and scientific library, in Cincinnati, to which he gave several thousand publications; and was pres. of the Natural History soc. of Cincinnati.

NANCE: a co. in n. interior of Nebraska; formed 1879, from what was formerly known as the Pawnee Indian Reservation. Pop., '80, 1,212.

NAUGATUCK: a tp. in New Haven co., Conn.; drained by Naugatuck river; traversed by Naugatuck railroad; including vill. of Naugutuck, where are manufactories of rakes, hoes, forks, knives, shears, and the works of the Goodyear Glove and Rubber company. Pop. of tp., '80, 4,274.

NAVIGATION, INLAND. No part of the world has grander or more serviceable water-ways than the U. S., and the natural facilities afforded by its lake and river systems are unparaleled. The Mississippi is not only in itself one of the largest rivers in the world, but several of its tributaries, as the Missouri, Ohio, Arkansas, and Red, are larger than the largest rivers of most other countries; and these tributaries again are fed by rivers of more than average size and importance. An area of 1,244,000 sq.m., comprising nearly all that part of the U. S. which lies between the Alleghanies and the Rocky mountains, is drained by this river and its tributaries, and a large part of this area is consequently made accessible to water-craft. The total commerce of the Mississippi and its tributaries is placed in round numbers at $2,000,000,000 annually. The chief articles of commerce on the upper Mississippi are grain, lumber, pork, flour and groceries; on the lower an interchange of grain and northern products generally is effected with the sugar, molasses, cotton, coffee, tropical fruits, and other products or imports of the southern states. On the Ohio river and its tributaries, which absorb fully $700,000,000, or nearly one-third of the entire yearly commerce of the Mississippi system, the chief articles of freight are coal, iron and its products, lumber, petroleum, furniture, salt, liquors, and groceries. Commerce on the Missouri river, of whose tributaries only the Osage and Yellowstone are even partially navigable, has to some extent ceased since the building of northwestern railways; but the products of the mines, in Montana and elsewhere, are still shipped down stream in large quantities. On the n. boundary of the U. S. the great chain of lakes, communicating through canals and through the St. Lawrence with the ocean, and through canals with the Mississippi river, affords another unique system of waterways. The larger proportion of the surplus grain raised in the states bordering on and west of the Mississippi finds its way to tide-water through these lakes, which also do a heavy commerce in coal, iron and its manufactures, lumber, and salt. So complete is the communication established by these two great systems of waterways that goods taken on board at New York may be transported to New Orleans without being transshipped. Other navigable waters in the U. S. are the Hudson river, through which the immense traffic of the Erie canal finds its way to and from the sea; the Kennebec, on which a large ice and lumber business are done below Augusta; the Penobscot, which has a large commerce in lumber below Bangor; the Connecticut, through which direct commerce with foreign cities is carried on to a limited extent, and which carries a good passenger and local trade; the Potomac, into which passes the coal-trade of the Chesapeake and Ohio canals; the James on which a considerable commerce is done in the products of Va.; the Alabama and its tributaries, on which large quantities of cotton are transported; and the Sacramento, which

carries a large and miscellaneous business. The San Joaquin, the Columbia, and the Williamette rivers are also navigable to a greater or less extent. Since 1870 congress has been very liberal in the appropriation of surplus revenues for the improvement of rivers and harbors, the last bill for this purpose, passed 1882–83, over Pres. Arthur's veto, distributing the sum of $28,743,875 throughout the various states for the purpose of improving I. N. But though undoubtedly many objects well worth the care of the national government have been attained in this way, there is reason to believe that a majority of the appropriations were secured rather for the personal benefit of the legislator, who might thus earn the ignorant applause of a portion of his constituents. The special appropriations that from time to time have been made for the purpose of facilitating commerce on the Mississippi river are far more practical in their aims. The bars at the efflux of the passes at the mouth of this river were early recognized as serious impediments to navigation; and, beginning with 1837, various appropriations were made to secure an increased depth, but no permanent improvement was effected until 1875, when James B. Eads was authorized to create and maintain a channel out of the south pass of the Mississippi, having an ultimate depth of 30 ft. The channel is now nearly finished, and has proved of great advantage. The improvement of other portions of the Mississippi and its tributaries also has called for financial assistance, both from the bordering states and from the national government.

NEAL, David: b. Lowell, Mass., 1837: has resided in Munich since 1861. He studied art under his father-in-law, the Chevalier Ainmuller, and under Piloty. He was the first American to receive the great medal of the Royal Bavarian acad. of fine arts, which was given him for his "First Meeting of Mary Stuart and Rizzio." He has also painted "The Chapel of the Kings, Westminster Abbey," "St. Mark's, Venice," "Return from the Chase," "James Watt," "The Burgomaster," and a number of portraits.

NEEDHAM: a tp. in Norfolk co., Mass.; bounded s. and n.e. by Charles river; traversed by the Boston and Albany railroad: including vills. of Grantville, Highlandville, Charles River Village, and Wellesley. The scenery of the tp. is very attractive; there are many fine residences. Its real and personal property for 1875 was valued at $5,011,551. Pop., '80, 5,252.

*NE EXEAT REPUBLICA: this writ is formally abolished by statute in N. Y. and in most other states.

NEILSON, Lilian Adelaide, the assumed name of Elizabeth Ann Brown: 1848–80; b. Leeds, Eng. She ran away from home to London, 1862; was educated through the kindness of a chance acquaintance; and made her début as an actress at the Royalty theatre London, 1865, playing "Julia" in the *Hunchback*. Her success was sufficient to secure her other engagements in London and the provinces; but it was not till 1871 that she made a pronounced hit in *Amy Robsart*. She immediately became one of the favorites of the English stage, and was equally successful in her tours through the U. S., 1872, 1876, and 1879. Her chief parts were the Shakespearean ones of "Juliet," "Rosalind," "Beatrice," and "Imogene." In 1872 she married Mr. Philip Lee, but the marriage was not a happy one, and she obtained a divorce, 1877.

NEOTTIEÆ: a tribe of orchidaceous plants having the pollen-masses powdery, granular, elastically cohering, and fixed to a gland or retinaculum; the anther paralel to the stigma, and persistent; the cells approximate. They are terrestial plants, with fibrous or tuberous roots, occasionally leafless, or supposed to be parasitic; chiefly inhabitants of temperate Asia, Australia, and Madagascar, but rare in Africa and beyond the tropics. There are 16 principal cultivated genera, three of which—Goodyera, Listera, and Spiranthes—are represented in the U. S.

NEPTUNE: a tp. in Monmouth co., N. J.; formed 1879 from part of Ocean tp.; including Asbury Park and Ocean Grove; which have become very popular watering-places. Pop. '80, 4,187.

NERAZ, John Claudius, D.D.: b. Anse, France, 1828: was educated in the seminaries of Lyon; became a Rom. Cath. missionary priest and labored in Texas; was called to San Antonio, Texas, 1873, to take charge of the parish of San Fernando; and was consecrated bp. of San Antonio, 1881.

NERSES: Armenian Patriarch of Constantinople; 1837–84; b. and d. Constantinople. He was educated, became a monk, was ordained priest at Adrianople, and was licensed to preach; consecrated bp. of Zeitun, thence translated to the see of Nicomedia, and, 1873, raised to the patriarchate of Constantinople (of the Armenians). Partly through his influence an article was incorporated in the Treaty of Berlin guaranteeing equal rights to Christians in Turkey.

NEVADA, Emma (stage name of Emma Wixom): b. Cal., 1861: studied vocal music in Italy; first appeared in opera in London, 1880, with Marie Van Zandt; subsequently sustained leading parts in Trieste, Pesth, Prague, Milan, Rome, Naples, and Paris, and made a tour of the U. S., 1884–85.

NEWMAN, HENRY RODERICK: b. Easton, N. Y., abt. 1845. He gave up the study of medicine to become an artist at the age of eighteen years. His talent immediately won recognition, and Emerson and other men of note took an interest in his early career. He went to France, 1870, and after traveling through Switzerland, settled in Venice, 1871, and later removed his studio to Florence. Ruskin has expressed admiration for his art. "Venice," "Tuscan Spring," the "Florence Cathedral," and the "Gulf of Spezia," are his most elaborate works; all of these water-colors (his favorite medium).

NEW ORLEANS EXHIBITION. In 1883, Feb. 10, congress passed an act incorporating the World's Industrial and Cotton Centennial Exposition. New Orleans was selected as the place for holding it, and 1884, Dec. 1, was fixed as the opening day. Foreign governments were notified, and efforts made to secure their participation. The upper city park, facing the river, was chosen for the site. The main building was 1,378 ft. long, and 905 wide, and covered 33 acres; being the largest exposition building ever erected. The government building, designed to hold the U. S. exhibit and the exhibits from the different states, was next in size; its length being 885 ft. and breadth 565; the other buildings were a horticultural hall, and an art building. Two buildings were erected by the Mexican government, one in the style of a Mexican hacienda. Buildings and grounds were lighted by electricity. The exposition was not opened till Dec. 16. Pres. Arthur started the machinery from Washington by touching an electric key. Of foreign countries 29 were represented. Mexico had the largest collection of exhibits, and all the Central American states were more fully represented than at any previous world's fair. The colored race had a special dept. for the exhibition of their work.

NEWTON, REGINALD HEBER, D.D.: b. Philadelphia, 1840; son of Rev. Dr. Richard N.; was educated at the univ. of Pennsylvania; and was ordained to the Prot. Epis. ministry. His position in the Episcopal church is in the extreme "Broad Church," which by its opponents is characterized as the rationalistic party. He has written much on industrial and social topics. Among his works are *Studies of Jesus* (1881), *Right and Wrong Uses of the Bible* (1883), *The Book of Beginnings* (1884), etc. Though Dr. N. gives strong utterance to his views, he is noted for kindliness of spirit, and fidelity as a Christian pastor. He is rector of the Anthon Memorial church, New York.

NEWTON, WILLIAM WILBERFORCE: b. Philadelphia, 1843; bro. of Reginald Heber N. He graduated, 1865, at the univ. of Pennsylvania. He has published some vols. of sermons for children, also *Essays of To-Day* (1879), *Priest and Man*, (a novel, 1883), and some vols. of verse. He is rector of a Prot. Epis. church, Pittsfield, Mass., and was the chief promoter of the "American Church Congress" whose first meeting was held, Hartford, Conn., 1885, May. It is composed of members of the various Christian denominations, and meets for discussion in a fraternal spirit, and in the interest of Christian union.

NEWTOWN: a tp. in Fairfield co., Conn.; bounded n.e. by Housatonic river; has manufactories of buttons, combs, belting, and wool hats. Pop. '80, 4,013.

*NIAGARA RIVER AND FALLS. Lyell's estimate that the falls wear away about one ft. of the precipice each year is considered a great error; this would mean an annual displacement of 1,500,000 cubic feet of rock. The displacement is now estimated at about half an inch of the face of the falls every five years. The great maelstrom called the Whirlpool, some distance below the falls, excites much interest. Its depths are unknown; a thousand feet of cord was found too short to reach its bottom. All the water pouring over the falls passes through the whirlpool and flows on and out through the cañon. Authorities state that at one time the falls were here and during thousands of years excavated the whirlpool. The grounds about the falls have lost much of their beauty by the destruction of timber and the building of unsightly mills. In 1878 Lord Dufferin, then gov.-gen. of Canada, conferred with Gov. Robinson of N. Y., in regard to taking measures to form an international park about Niagara. Gov. Robinson in his message to the N. Y. legislature, 1879, urged some action in the matter. By resolution the commissioners of the state survey were charged to investigate the question. They found that it would be practicable to restore the scenery about the falls to its natural aspect by clearing away the buildings from a narrow strip of land, 100 to 800 ft. broad and a mile long, and planting it with trees which would screen from view the buildings of the village; a map was made showing what lands should be taken for the purpose. An act providing for the selection and appropriation of the lands was framed, but was defeated in the senate, 1880. Friends of the measure succeeded however in keeping alive public interest in the matter, and a society was organized, called the Niagara Falls assoc., through whose efforts the defeated bill was again brought before the legislature and passed, 1883. A commission was empowered to proceed to condemn through the courts the lands needed, which adopted in the main the plan before proposed by the commissioners of the state survey. The lands selected were surveyed and appraised

at a valuation of $1,433,529.50. A bill appropriating this sum was passed, 1885, which declares that the lands are purchased by the state, that they may be restored to and preserved in a state of nature; and that every part of them shall be forever free of access to all mankind. Following these directions, the lands were, with form and ceremony, transferred to the state, 1885, July 15, in the presence of distinguished officials from Canada and the U. S. The Niagara river is crossed near the falls by a cantilever bridge (q.v.), built by the Michigan Central railroad, 1883. It passes over a chasm, 859 ft. wide, and its clear span across the river between the two towers is 495 ft. The bridge has the longest double-track span truss of any yet built.

NICHOLLS, Francis T.: b. La., 1834: graduated at the U. S. military acad., 1855; and took part in the Seminole war in Florida. He was a brig.-gen. in the Southern army, in which service he lost a leg and an arm. He afterward held a position of eminence at the bar of Assumption parish. In 1876 he was elected, as a democrat, gov. of La., and after a severe contest with the republicans under Packard, (q.v.) was duly confirmed.

NICHOLSON, William Rufus, D.D.: b. 1822: ordained presbyter in the Prot. Epis. church, 1847. He is prominent among the bishops of the Reformed Epis. church, having been consecrated in that office, 1876. He has written several monographs, among others, *The Lord's Supper*, *Call to the Ministry*, *Sanctification*, etc. He is pastor of the 2d Ref. Epis. church, Philadelphia.

NILES, William Woodruff, S.T.D.: b. Canada, 1832: graduated at Trinity coll., Hartford, Conn., 1857, and at Berkeley divinity school, Middletown, Conn.; was ordained priest in the Prot. Epis. church at St. Phillip's church, Wiscasset, Me., 1862. He was a tutor at Trinity coll.; rector of St. Phillip's church, Wiscasset; prof. of Latin, Trinity coll.; rector of St. John's church, Warehouse Point, Conn. He was consecrated bp. of N. H. While at Hartford he was editor of the *Churchman*, 1870.

NINA, Lorenzo, Cardinal: b. Recanati, Italy, 1812. He studied theology and law in the univ. of Rome; was ordained, 1835; and devoted himself to the study of canon law. He was employed by Pius IX. in many delicate matters requiring ability and judgment, and acquitted himself so well that he was made assessor of the Holy office. He steadily rose in favor with the papal court and was created cardinal, 1877. Pope Leo XIII. appointed him pontifical sec. of state, 1878.

NINDE, William X., D.D.: b. Cortlandville, N. Y., 1833: graduated at Wesleyan univ., 1855; was pastor of Trinity Meth. Epis. church, Cincinnati, and Central church, Detroit. He has had charge also of three chapels in Cincinnati. He was prof. of pastoral theology at Garrett Biblical institute, Evanston, Ill. He was elected bp. of the Meth. Epis. church, 1884.

NOLAN: a co. in n.w. Texas; formed in 1876; unorganized, and attached to Shackelford co. for judicial purposes: 900 sq. m. Pop. '80, 640—5 colored.

NORTHBRIDGE: a tp. in Worcester co., Mass.; drained by the Blackstone river; intersected by the Providence and Worcester railroad; including vills. of Rockdale, Northbridge Center, Whitinsville, and Northbridge. The latter contains many large manufactures of shirtings, cotton prints, and machinery, besides a quarry of granite. Pop. of tp., '80, 4,053.

NORTH BROOKFIELD: a tp. in Worcester co., Mass.; including North Brookfield, a vill., where boots and shoes are largely manufactured. Pop. of tp. '80, 4,459.

NORTHRUP, Henry Pinckney: b. Charleston, S. C., 1843: graduated at Mt. Saint Mary's coll., Md., and at the theol. sem. He was ordained priest in Rome, 1865, and returning to America shortly afterward was appointed pastor of the Rom. Cath. church at Wilmington, N. C. He held several pastorates in N. and S. Car.; was consecrated bp. of N. Car., 1882, and promoted to the see of Charleston, 1883.

*NORTHWEST TERRITORIES. In 1876 the district of Keewatin (q. v.) was detached from the N. W. T., whose area was, 1881, again slightly reduced by the shifting of the limits of Manitoba n. to 52° 30′ and w. to 101° 20′. In 1882, May 8, an order in council was passed, dividing the remaining portion into four districts, named respectively Assiniboia, Saskatchewan, Alberta, and Athabaska (see these titles in *Supp.*). These districts are under the authority of a lieut.-gov. whose seat of government was, 1883, removed from Battleford in Saskatchewan, to Regina in Assiniboia. The management and development of the entire n.w. of Canada began to attract great attention, in consequence of the vigorous prosecution of the Canadian Pacific railway (see Canada), and resulted in increased immigration and much wild speculation in land. The fever reached its height in 1882 when about 72,600 persons settled in Manitoba and the N. W. T.; 613,282 acres were purchased, and 2,085,853 acres were obtained from the government on homestead and pre-emption entry. In 1883 the possibility of the public domain passing into the hands of any other than bona fide settlers was reduced to a minimum by the appointment of four homestead inspectors whose duty it was to visit the farms located as free grants, and ascertain that the settlers were actually performing the conditions of continuous residence and cultiva-

tion. Disputes, however, soon began to arise between the new settlers and the Indians and half-breeds who had long been in possession of the soil. In Manitoba certain privileges were granted to the squatters which were withheld from those in the N. W. T. The discontent there was greatly increased; and finally in the spring of 1885, resulted in open rebellion, headed by Louis Riel (q. v.). The rebellion, though serious for a time, and involving some brutal massacres by the Indians, was soon suppressed.

NORWOOD, THOMAS MANSON : b. Talbot co., Ga., 1830 : graduated at Emery coll., Ga., 1850, and at law, 1852; settled in Savannah, Ga., 1852. He was in the Ga. legislature, 1861–2, and was elected U. S. senator as a dem., 1871, serving six years.

*NOVELS. "The art of fiction," says Mr. Howells, in his famous essay on Henry James, Jr. (*Century*, '82, Nov.), "has become a finer art in our day than it was with Dickens and Thackeray. . . . Those great men are of the past—they and their methods and interests. . . . The new school derives from Hawthorne and George Eliot rather than any others ; but it studies human nature much more in its wonted aspects, and finds its ethical examples in the operation of lighter, but not really less vital motives." The whole essay was assailed with much clumsy ridicule, especially from the British press, and these sentences were particularly provocative of transatlantic humor. Yet they embody a simple truth. Among living novelists, though there may be none worthy of being ranked with the great masters who have gone, yet as a class the recent writers strive far more anxiously than did their predecessors after perfection of literary form. They may produce only delicate filagree work, but it is at least exquisitely finished. They care more for elegance than for strength. They shun great passions, the moving accident is no longer their trade; but they sketch with rare truth and precision the men and women of every day life. Howells, himself, James, Lathrop, and Aldrich are the leaders of this school in the U. S.; William Black, Thomas Hardy, and W. E. Norris may be placed at the head of the same class in England. But although these and their followers are usually looked upon as the representatives of modern fiction, there are a number of popular authors both in England and in the U. S., who refuse to fall into the same group and whose methods are more closely allied to those of the old school. R. D. Blackmore, George Meredith, and J. H. Shorthouse, in England ; Marion Crawford, Bret Harte, and Geo. W. Cable, in America ; much as they differ from each other, are alike at least in this, that they portray the inconventional rather than the conventional human being; deal with great emotions ; are romance-writers more than novelists. It is true that James and Howells, Black and Hardy, not infrequently overstep the limits of their class. The two Americans indeed are perhaps at their best when they do so, the Englishmen almost invariably at their worst. There are some critics who are inclined to rank *A Foregone Conclusion* and *The Undiscovered Country* at the head of all of Howells' works; they are likewise his only works to which the epithets powerful and passionate could be applied. Mr. James' early admirers thought that they had discovered in the author of *The Madonna of the Future* and *The Passionate Pilgrim* the promise of a great romance writer; and those sketches still remain a portion of his best work. But regret at the degradation of great talent is the only emotion excited by the bathos of Black's more ambitious work, such as *Sunrise*, or the death-scene in *McLeod of Dare*. Hardy, it is true, successfully transported us out of the range of everyday emotions in his *Far from the Madding Crowd*, but he rarely reaches that height ; he not seldom falls to a very low level, and his best work is represented by his sketches of young girls and of rustic oddities. The same influences that have been at work in the fiction of the English speaking nations are observable, though in another form, in the modern fiction of France. Hugo and the romanticists are of the past ; Zola and his school of brutal realists are of the present. There may seem at first to be little connection between these coarse delineators of the lowest passions of our nature and the decorous Anglo-Saxon portrayers of drawing-room interiors ; yet both are a product of the passion or affectation for truth, the hatred of cant and insincerity which are the distinctive features of the present age. "Give us what is true, not what is pretty," seems to be the cry of the period; and it is answered in different ways in different localities. But not all French fiction is steeped in iniquity. Daudet, Gustav Droz, Erckmann-Chatrian, Th. Bentzon, Henry Gréville, Hector Malot, even Ludovic Halévy in his *Abbé Constantine*, have given us novels which are remarkable for literary finish, and have little or nothing that is morally objectionable. In Germany there is a general complaint that realism is invading and ruining every province of art. George Ebers, Spielhagen, Miss Marlitt, and Miss Von Hillern, are the only names of great note in contemporary German fiction. In Spain and in Italy a multitude of new novelists have arisen. Perez Galdos in the former country, Dr. Amicio and Barilli in the latter, have recently been translated into English and have been favorably received here. But the greatest writers of fiction with whom translation has of late familiarized us are the Russian Tourgenief and the Norwegian Bjornson. The powerful, gloomy novels of the former, and the fresh, breezy, idyllic peasant tales of the latter have come like a revelation to some of the

jaded novel readers of our climes; and have made them anxious to know more of the languages and literatures which are represented by such masterpieces.

NOYES, Edward Follansbee: b. Haverhill, Mass., 1832: graduated at Dartmouth coll., 1857; removed to Cincinnati, O., and was admitted to the bar. He fought in the union army during the civil war, and rose from the rank of major to that of brig.-gen. After the war he became city solicitor of Cincinnati; was elected probate judge of Hamilton co., 1866, and gov. of Ohio on the repub. ticket, 1871. He was minister to France, 1877–81.

NUBAR PASHA: b. abt. 1830; of an Armenian family long settled in Egypt. He entered into public life, and rapidly gained a European reputation for ability and probity. He has been foreign minister, minister of justice, and ambassador, and represented the Khédivé at the congress of Berlin, 1878. He is the originator of the mixed courts for the adjudication of causes between Europeans and Egyptians. In 1884 he was pres. of the Khédivé's council, minister of foreign affairs and of justice.

*NUISANCE. The term nuisance is derived from the French word *nuire*, to do hurt or to annoy, and is applied in English law indiscriminately to infringements upon the enjoyment of proprietary and personal rights. The principal classes of nuisances are those which arise from the negligent use and management of real property; and from keeping ferocious animals. Thus a man may become responsible for a N. by fixing a spout or any projection which causes, or has a tendency to cause, an unnatural quantity of rainwater to descend on his neighbor's house and land; by erecting and working a noisy smith's forge, or noisy workshops, or an offensively odorous tallow-furnace, smelting-house, dye-house, etc., or burning lime or bricks, or erecting a glass-house or brew-house so near to a dwelling-house that the smoke and smell thereof enter the latter and render it unfit for habitation. So the pollution of springs and running streams may constitute a N., for which the riparian proprietors may recover damages. It is an old principle of law that if a person collect together a crowd of people to the annoyance of his neighbors, that is a nuisance for which he is answerable. So the negligent overloading of the floors of warehouses and buildings causing injury to goods of tenants below the floor so injured, and the neglect of an owner to keep his houses perpendicular, are examples of nuisance. So whoever keeps an animal accustomed to attack or bite mankind, with knowledge of its dangerous propensities, is, *prima facié*, liable to an action for damages at the suit of any person attacked or injured by the animal, without proof of any negligence or default in the securing or taking care of it. Not only is the perpetrator of a N. liable in damages to the persons injured thereby, but he is also punishable for a misdemeanor. But for this latter purpose the N. must be not confined to individuals, but must have within its range the community or vicinage as a class. It is not necessary that the N. be one positively deleterious to health. It is enough if it offend the senses or disturb the comfort of the community, or shock the public morality.

NURSES, Training of: The demand for skilled and well-educated nurses in our large cities and towns has led to the establishment of training schools where men and women may be taught the scientific management of invalids. In these schools thorough instruction is given as to surgical emergencies, besides lessons in bandaging, and in the preparation of food for the sick. In addition to clinical teaching, there are elementary courses in hygiene, anatomy, and physiology. At the end of the course, which generally lasts for two years, diplomas are given certifying that the holders are experienced and competent nurses. In New York the employment bureau of the Young Women's Christian association furnishes trained nurses on application. There are schools connected with the Bellevue hospital (charges, $10 per month, first year, $16 second year), the Charity hospital (charges, $10 per month, first year, $15, second year), and the New York hospital. The Philadelphia school, in connection with the college of Physicians and Surgeons, is doing excellent service. There are good schools at Boston, Albany, New Haven, and other cities. The Connecticut soc. for the training of nurses has issued a serviceable manual on the science of nursing, and there is a growing literature on this important subject. The *Medical Register* publishes lists of the skilled nurses in New York, with their addresses. The schools are careful in the selection of their pupils, and require recommendations as to character as well as a fair education in the rudimentary branches. There were, 1883, 23 training schools for nurses in the U. S., with 97 instructors, 475 pupils, and 779 graduates. These numbers are now much increased.

*OAT, or Oats: in America have been cultivated ever since the advent of the first white settlers. They were sown, with other cereals, by Gosnold on the Elizabeth islands, 1602; were introduced in Massachusetts Bay, 1629; and their cultivation has since extended to every state in the Union. A species of wild O. grows quite extensivelively in California, and yields a good hay, but the grain is worthless. In the northern states O. are cultivated more successfully than in the southern, owing to the attacks of rust in the latter region. The average yield in 1883 in several of the northern states and territories was over 35 bushels to the acre (in Arizona it reached 43 bushels) while in Florida, North and South Carolina, and Georgia, it was

less than 10 bushels. In 1884 the total production of O. in the U. S. was 583,628,000 bushels, the number of acres occupied by the crop 21,300,917, and the value of the crop $161,528,470. This crop was the largest ever produced in the country; the average was larger by 3,000,000, than in 1882, and the average price fell to 27.7 cents—a lower figure than had ever before been reported by the Bureau of agriculture except the average of 24.6 in 1878. The lowest state average in 1884 was 19 cents, in Nebraska; the highest was 60 cents, in Florida. All but a very small fraction of the crop is consumed at home. The largest amount ever exported in a year was 5,452,136 bushels, in 1879; in 1884 the amount exported was 1,760,376; in 1883 it was only 461,496. The leading oat-growing state is Illinois, which in 1883 produced 102,780,000 bushels, more than one-sixth of the entire crop of the U. S. It was followed by Iowa with 68,403,600 bushels, and New York with 42,071,400 bushels. The weight of a bushel of American O. varies from 30 to 40 lbs., while Scotch O. weigh from 40 to 50. In the Middle and Northern states the almost universal custom is to sow in the spring, as soon as the soil is in a condition for tilling, but in the south fall sowing generally prevails. The seed is sown broadcast, from 2 to 5 bushels being used to the acre. In the most northern latitude it ripens in 90 days or even less, but in the southern a longer time is required.

*OATH. The form of administering the O. to witness in courts of justice varies slightly in different states, but the substance is the same as at common law. It is not required that the witness should have any particular religious belief, or even that he should believe in a God and a future state in order that his testimony may be admissible. An atheist must make an affirmation, usually in the words, "You do solemnly and sincerely affirm, etc.;" and the testimony which is given upon such affirmation is subject to the law in relation to perjury, as if given upon oath. If any particular form of O. is more binding upon the conscience of the witness, that mode of administering it will be adopted.

OBEIDULLAH, Sheikh: 1832–83: chief of the Koords, of noble Arab descent; lived in the stronghold of Nehrieh, near the Persian frontier. He ruled over many Turkish and Persian villages in his neighborhood. In 1880 he engaged in a war with Persia on his own account, which he was compelled to abandon at the command of his sovereign, the sultan of Turkey. He again prepared to invade Persia, 1881, but was called to Constantinople where he was confined until he escaped, 1882. The sultan then sent a force against him which captured and pillaged his stronghold, and he was sent to Mosul, where he was imprisoned until shortly before his death.

OCARINA: a musical instrument originally invented by an Italian boy, and improved by French musicians. It was first a molded piece of clay a few inches long, with holes for keys, a mouth piece, and hollowed within. Different sizes are now made for the different parts in music; and a piston at the end is used to temper the note. A row of keys in the improved instrument takes the place of the original holes. The O. is an instrument of much sweetness, and is now used in concert halls.

OCCULTISM. An occultist is "one who studies the whole range of psychological, physiological, cosmical, physical, and spiritual phenomena;" hence O. seems to embrace the whole cycle of human knowledge, but prefers those subjects which, for want of explanation, are not yet transferred from the realm of the imagination to reason. It is a favorite word in the publications of the Theosophical soc., founded, 1875, by Col. Henry S. Olcott and Mme. H. P. Blavatsky. Olcott had been a quartermaster in the U. S. army during the civil war, was afterward in the Internal revenue service, and a man-about-town in New York; his conversion to his new theories was in 1874. There are various small publications by the soc. including a journal; *Isis Unveiled*, by Blavatsky, 2 vols., N. Y., 1877, etc. Shortly after this publication these two went to India, embracing the tenets of Buddhism, and beginning what may be called a countermission in the e. of India and Ceylon: see a *Buddhist Catechism*, H. S. Olcott, London, 1881, and for an account of journeys and healings, the *Pall Mall Gazette*, in the early spring of 1884. The object of the founders of the soc. is "to experiment practically in the occult powers of nature, to disseminate among Christians information about the oriental religious philosophies, and spread among the 'poor benighted heathen' such evidences as to the practical results of Christianity as will at least give both sides of the story to the communities among which missionaries are at work."

The book of Mme. Blavatsky, exponent of occultism, has little to do with anything but the imagination. The wonders here enumerated are considered by scientists as magical, due to jugglery, trained manual and mental dexterity, or neurosis: see the works of the late Dr. Beard on hypnotism, muscle-reading, etc.

OCEAN: a tp. in Monmouth co., N. Y.; including Long Branch vill., Branchport, Monmouth Beach, and Seabright—places of well-known summer resort. Pop. '80, 6,027.

OCHILTREE: a co. in w. Texas; formed 1876; unorganized, and attached to Wheeler co. for judicial purposes: crossed by North Fork of Canadian river; 900 sq. m.

O'CONNELL, EUGENE, D.D.: b. county Meath, Ireland, 1815: studied at Maynooth, where he was ordained a Rom. Cath. priest, 1842; came to the U. S., 1851. He performed missionary labors, and was prof. at the sem. of St. Thomas, Cal.; was made bp. of Flaviopolis and vicar apostolic of Marysville, 1861; was transferred to the see of Grass Valley, Cal., and Nev., 1868; and was relieved of this charge at his request, 1884, and appointed titular bp. of Joppa.

O'CONNOR, JAMES, D.D.: b. Ireland, 1823. He emigrated to America, 1838, and was educated at Philadelphia, and at the coll. of the Propaganda, Rome, where he was ordained, 1848. He returned to America, and labored in Pittsburgh and Philadelphia, in charge of theol. seminaries. He was consecrated titular bp. of Dibona and vicar apostolic of Nebraska, 1876, and took up his residence in Omaha, where he established Creighton coll., and several schools. He has been prominent in aiding the colonization of Neb., and is well known as a theologian and scholar.

OCONTO: a city, cap. of Oconto co., Wis.; on the w. shore of Green bay, at the mouth of Oconto river; 28 m. w. by e. of Green bay; on the Chicago and Northwestern railroad. It has 7 churches, a court-house, a bank, and large steam sawmills, as pine lumber is prepared here in large quantities. Pop. '80, 4,171.

ODGER, GEORGE: 1820–77; b. Eng. When very young he was apprenticed to a shoemaker; afterward settled in London, where he became prominent as a labor reformer. He was a member of the society of Cordwainers, and was also one of the most prominent members of the Reform league.

O'FARRELL, M. J., D.D.: b. Limerick, Ireland, 1832: studied at All Hallows, Dublin, and St. Sulpice, France, and was ordained a Rom. Cath. priest, 1855. He came to America; was a missionary for 13 years; was stationed at St. Peter's church, New York, 1868–81; and was consecrated the first bp. of Trenton, N. J., 1881.

*OGDENSBURG, N. Y.: is the w. terminus of the Ogdensburg and L. Champlain R. R. and the n. terminus of the Rome Watertown and Ogdensburg R. R., and the headquarters of the Northern Transportation co.'s line of steamers. It has fine buildings erected by the U. S. for a post office, custom house, and court rooms, at a cost of $275,000; and a Rom. Cath. cathedral. It contains nine public schools, the Ogdensburg Educational institute, six churches, two banks, two daily and two weekly papers, fine parks, a marine railway, and an immense grain elevator. It has a prosperous trade and extensive manufactures of leather, machinery, flour, etc. Pop. '80, 10,341.

O'HARA, JAMES E.: b. New York, 1844: received an academical education, and was admitted to the bar of N. Car., 1871; was engrossing clerk to the constitutional convention of N. Car., 1868, and to the legislature, 1868–9; was elected as repub. to the XLVIIIth and XLIXth congresses.

*OIL-WELLS and OIL-TRADE. Oil, though found mainly in the Silurian and Devonian formations, is not confined to the rocks of those ages. Prof. Hitchcock enumerates 14 different formations that produce it. The porous beds of sandstone serve as reservoirs for holding the oil. When wells were first driven nothing was known of "oil-sands;" the drilling was continued, regardless of the formation, till indications of oil were obtained; but it was soon learned from the wells at Oil Creek, that the sands were its chief source, and that by deep drilling, three distinct layers known as first, second, and third sands might be discovered. Oil obtained from the first sands, at small depths, is generally mixed with water from the surface rocks. The first sand averages 40 ft. in thickness, with an interval of 105 ft. to the second, averaging 25 ft.; then follows an interval of 110 ft. before the third sand is reached, this last having a thickness of 35 ft. Wells may be close together, and yet produce very different qualities of oil. A black oil has been obtained in some places from a fourtsh and, known as the "black-oil-sand." No entirely satisfactory theory has been advanced to explain the formation of petroleum. It is generally held to be originally derived from animal or vegetable remains, but the manner of derivation has not been uniform Before the Pennsylvania oil wells were discovered, factories for the manufacture of oil from coal had been started; these were all subsequently turned into oil refineries. After the drilling of the wells in the Oil Creek district the yield was so great that barrels could not be had to hold it, and much of it was lost. In 1861 it was sold as low as ten cents a barrel. In the mechanical process for securing the oil, after the site is chosen for the well, the derrick is built. This takes about 30 days, and costs $400; for driving the drills an engine of 10 to 15 horse-power is used. The drilling tools are the same as used in sinking artesian wells; with them a thread can be cut on a bar that is 1,500 ft. below the surface, another bar screwed to it, and both drawn up. A string of tools weighs about 2100 lbs., and costs about $900. Two methods are employed in drilling, known as the wet and dry. In the dry process, the water from the surface strata passed through is cut off. An 8 in. iron tube is first driven to the bed rock; then the drills are put in, and an 8 in. hole is driven down, till all the strata containing water are passed; smaller drills are then used, and a hole tapering to $5\frac{5}{8}$ in. is driven a short distance; a tube with a steel shoe is screwed

in this tapering hole to a water-tight joint ; this keeps out the water, and the hole is driven the remaining distance of 5⅝ in. diam. When oil is reached, a 2 in. tube, having the bottom section perforated, is put in and connected with the tank ; the oil then flows until it is exhausted, or the pipes become clogged with paraffin produced by the low temperature caused by the evaporation of the oil when the pressure is relieved. When the oil stops flowing a pump is used, one engine being used to drive the pumps of 15 or 20 weils. The wells are generally driven along the border of a tract, so as to draw as much oil as possible from the adjoining claim. It has been estimated that 15 ft. of oil bearing sand will yield 15,000 barrels per acre. Not unfrequently a well yields two different qualities of oil, owing to two different strata having been passed through. The average duration of a well is said to be five years, but some have been pumped for twelve years, and others have given out in a week. Some of the famous wells have yielded over 200,000 barrels. Each well has a tank to hold the oil till it is run off in the storage tanks of the pipe lines. When the oil is delivered to the pipe line co., the owner receives from them a certificate, agreeing to deliver to his order, at a point named, so many barrels of oil, upon payment of charges ; these certificates are bought and sold at the oil exchanges. See PIPE-LINES. The ordinary petroleum products in the market are crude oil, refined oil, naphtha, lubricating oil, paraffin, and coke or the residuum after distillation. 261,100,171 bbls. have been obtained from the oil region of Penn. since its discovery in 1859. In the following table are given the yearly production, the exports, and their value for the last ten years :

Year.	Production.	Exports, galls.	Value.
1874	11,188,000	247,806,000	$41,245,000
1875	10,083,000	221,955,000	30,078,000
1876	8,823,000	243,660,000	32,915,000

OKLAHOMA : a fertile stretch of country near the center of the Indian territory ; abt. 1,800 sq. m., or 1,887,800 acres. The name was given to the land by Col. Boudinot, meaning, in Cherokee, "the home of the red men." The U. S. govt. has given this land to friendly Indians, and has pledged its faith that no white settlers shall be allowed to occupy the territory. Much disturbance has been caused since 1880 by violators of this law—"boomers," as they are called, who knowing the attractiveness of the country, have repeatedly endeavored to march into it from the Kansas border; but who have been steadily repulsed by U. S. officials, sometimes with the aid of troops. Capt. David L. Payne (d. 1884) was the leader of the "boomers," and protested that the O. territory was public domain, the Indians having no special claim to it. Payne and his successor, Capt. Couch, succeeded in combining many settlers in Kansas against the government, and their sentiments were made known in a convention at Topeka, 1885, Feb. 3. In answer to their protest, Pres. Cleveland assured the "boomers" that the laws against the immigration of whites would be rigorously enforced.

OLD SOUTH CHURCH, Boston. A dispute in the First Congregational society in 1669 over the "half-way-covenant" resulted in the withdrawal of 52 members who favored that measure, and the formation of the Third Congregational society. A small house of worship was built on the corner of Milk and Washington streets, on land originally owned by Gov. Winthrop and deeded by Madame Mary Norton. Their first minister was the Rev. Thomas Thacher; and the Rev. Samuel Willard, afterward vice-president of Harvard coll., was settled as his colleague in 1676. In 1687, Gov. Andros forced the congregation to open their doors to Episcopalians, who held morning services there for two years. The funeral services of Lady Andros were held here ; here Benjamin Franklin was baptized; and here, 1696, Judge Sewall, a member of the church, and father of one of its pastors, the Rev. Samuel Sewall, the "weeping prophet," publicly confessed contrition for his action in the witchcraft trials. In 1727 a brick building was erected, and was called the "South Church," until another was established on Summer street. The interior had two galleries and a high pulpit, still remaining ; a sounding board, square pews, and elevated seats in front of the pulpit, for elders and deacons. On the Sunday morning in 1746 when New England was expecting the descent of D'Anville's fleet, a violent gale arose while the Rev. Thomas Prince, pastor of the church, was praying, and his fervent petition that the storm might be turned against the enemies of his country, wat abundantly answered when news came of the wreck of the fleet off Nova Scotia. Warren delivered his famous anniversary address on the Boston massacre in this

pulpit, though surrounded by British soldiers. In 1770 a town meeting waited here while Samuel Adams went to urge Gov. Hutchinson to withdraw his regiments. In 1773, Nov., another town meeting was held in the church to protest against the landing of the cargo of tea. In Dec., 7000 persons, who could not find room in Faneuil hall, came here to oppose the landing of the tea, and to organize the historic "tea-party." The church was occupied, 1777–82, as a riding-school by the British; the pews were destroyed, the galleries used as a refreshment room, and much of Mr. Prince's valuable library burned for fuel; the congregation meanwhile worshiping in King's Chapel. The annual "election sermon" was preached in this church from 1712 to 1872. At the beginning of the present century, this was the only one of the ancient Congregational churches of Boston that did not become Unitarian. The church barely escaped the fire of 1872, and in 1873, the congregation removed to a new building on the Back Bay, of the style of architecture known as the Gothic of northern Italy, and costing $500,000. The old church, after much opposition, was leased temporarily to the government for a post-office, and finally purchased for $430,000, with funds collected from all parts of the U. S., by an "Old South preservation society." It is now used as a museum of colonial antiquities and for occasional lectures. Among late pastors of this church have been Joshua Huntington, B. B. Wisner, George W. Blagden, and Jacob M. Manning. Its present pastor is George A. Gordon, D.D.

OLEOGRAPH: a chromo-lithograph which has been "roughed" on a lithographic stone engraved so as to imitate canvas. The resemblance to oil-painting is further increased by mounting the O. on canvas, sizing, and varnishing. The colors used in printing oleographs are a little darker than in the case of chromo-lithographs in imitation of water-color paintings.

*OLEOMARGARINE. The English house of commons declared, 1881, that the substances composing O. were innocuous, and that good butterine was better than bad butter. The industry is now largely carried on in the U. S. According to analyses made by Dr. Henry A. Mott, of New York, the constituents of O. are: water, 11.203; butter solids, 88.797; the constituents of butter made from cream being: water, 11.968; butter solids, 88.032. Acts were passed by the N. Y. legislature, 1882, regulating the manufacture and sale of imitation butter; and prohibiting the coloring of the same in semblance of dairy products. The act of 1884, "to prevent deception in sales of dairy products," absolutely prohibited the manufacture from any oleaginous substance of "any article designed to take the place of butter or cheese produced from pure unadulterated milk or cream of the same." The provisions of this law aimed at the closing of all the O. factories, as it was found that the markets were filled with the imitation, in semblance of the real article; and that, notwithstanding the innocuous qualities of properly made oleaginous butter, substances derived from grease and rancid fats were frequently added. All these laws have been dead letters; and in 1885, June, the court of Appeals made void the act of 1884. Perhaps the simplest test for the detection of O. is by chemical analysis as follows: Potassic hydrate is used to saponify the fat, which is then mixed with 50 c. c. of alcohol. If the solution is clear, the soap is decomposed and the acids are weighed. If the percentage of these fat-acids reaches as high as 95½ it may be asserted that the substance is oleaginous, as their percentage in cream butter is about 87. Weak sulphuric acid should be used in decomposing.

O'NEILL, Eliza; (Lady Becher): 1791–1872; b. Ireland. Her father was manager of a strolling company, and at a very early age she became familiar with the stage. Her fame gradually extended, until she secured an engagement in Dublin and eventually in London, where she first appeared as "Juliet," 1812, Oct. 6. Her success was immediate. But at the height of her popularity she retired, on her marriage, 1819, to William Wrixon Becher, M.P. for Mallow, who was knighted, 1831, and who died, 1850. Miss O. is currently believed to have been the original of Thackeray's character of "The Fotheringay" in *Pendennis*.

ONONDAGA: a t. in Onondaga co., N. Y.; drained by the Onondaga creek, and incl. Danforth vill. Pop. '80, 6,358.
